55	Mount Spurr	61°17'58"	152°15'04"	F, SG
56	Crater Peak	61°15'56"	152°14'19"	F, CLac, WSh

[a]Abbreviations:

ac - acid spring, ph <5.5.
c - chloride anion dominant.
CL - Crater Lake.
F - fumarole.
G - geyser.
GV - gas vent, boiling point.
h - bicarbonate anion dominant.
HS - hot spring, T >50°C.

MP - mud pot.
s - sulfate anion dominant.
SF - superheated fumarole.
SG - steaming ground.
WL - geothermal well.
WS - warm spring, T <50°C.
? - activity questioned where unconfirmed.

[b]Sites 1 and 2 are east longitude.

LOCATION INDEX

[a]Latitude, longitude, and elevation are given for the highest point on the volcano, except for those volcanoes with calderas. If there is an active eruptive center within the caldera, the latitude, longitude, elevation listed are for the eruptive center.When the elevation of the eruptive center is lower than the elevation of the caldera rim, the maximum elevation of the rim is the second listed value. When there is no active eruptive center, the position given is for the center of the caldera, and listed elevation is for the highest point on the rim.

[b]Rock codes are B - basalt, BA - basaltic andesite, A - andesite, D - dacite, RD - rhyodacite, and R - rhyolite. Mineralogical modifiers are hb - hornblende and px - pyroxene.

[c]Letters used after the primary morphologic designation have the following meanings:

A - indicates activity within a summit caldera or large crater.
C - indicates that this new volcano formed on the rim or flank of an older caldera.
P - indicates that smaller cones or vents occur on the flanks of calderas, stratovolcanoes, or shield volcanoes.
S - indicates that larger satellite volcanoes occur on the flanks of calderas, stratovolcanoes, or shield volcanoes.
- a number combined with S or P gives the number of satellite volcanoes, cones, or vents. Sometimes this value is a minimum.

[d]Geothermal potential indicates estimated potential for presence of developable hydrothermal system.

C - Confirmed: a hydrothermal system with temperatures suitable for power generation has been confirmed by direct observation or by drilling.
G - Good: abundant thermal springs and/or fumarolic activity.
F - Fair: some thermal springs and/or fumarolic activity or Holocene activity with geologic evidence of a shallow magmatic system.
P - Poor: no surficial thermal manifestations or geologic evidence of a shallow magmatic system.

[e]Map numbers V1-V6 are east longitude.

-- = no data.

[a]Per mil with respect to standard mean ocean water (SMOW). DGGS samples analyzed at Southern Methodist University, Dallas, Texas.

[b]Geothermometers:

Quartz -- Fournier and Potter (1982). Adiabatic geothermometer used for boiling springs.
Chalcedony -- Fournier and Potter (1982). Adiabatic geothermometer used for boiling springs.
Na-K -- Fournier (1981). Fournier's equation used.
Na-K-Ca -- Fournier (1981).
Mg Correction to Na-K-Ca -- Fournier (1981); Fournier and Potter (1979). NC - no correction.
K-Mg -- Giggenbach (1988).
Mg-Li -- Kharaka and Marinor (1989).
Na-Li -- Fouillac and Michard (1981).
$\delta^{18}O$, H_2O-SO_4 -- McKenzie and Truesdell (1977).

[c]Katzenstein and Whelan (1985).

[d]Collected by DGGS. Analyzed by DGGS and University of Utah Research Institute (Salt Lake City, Utah).

[e]Analysis of water collected from Weber-separator at well-head (Motyka and others, 1988).

[f]Ivan Barnes, U.S. Geological Survey, written commun. (Menlo Park, California).

[g]VTTS = Valley of Ten Thousand Smokes; Keith
