The magnetic contours shown on this map represent the total anomalous
 magnetic field of the earth. Variations in this field are caused by the
 variable magnetic character of rock units crossed by the survey flights,
 and hence, can be used to estimate the apparent location of rocks rich in
 magnetic minerals. Such rock units may be either at the surface of the ground
 or buried beneath it. Anomalies show both positive and negative variations
 depending on the shape, attitude, and constituents of local rocks. Geophysical
 interpretation will be helpful in determining boundaries or depth of burial of
 anomaly-causing rock units. Some anomalies may be impossible to interpret
 without further geologic information. Basic profile data is retained at the
 Division of Geological Survey and should be consulted for detailed analysis.
