AEROMAGNETIC SERIES
The magnetic contours shown on this map represent the total anomalous
magnetic field of the earth. Variations in this field are caused by the
variable magnetic character of rock units crossed by the survey flights,
and hence, can be used to estimate the apparent location of rocks rich in
magnetic minerals. Such rock units may be either at the surface of the ground
or buried beneath it. Anomalies show both positive and negative variations
depending on the shape, attitude, and constituents of local rocks. Geophysical
interpretation will be helpful in determining boundaries or depth of burial of
anomaly-causing rock units. Some anomalies may be impossible to interpret
without further geologic information. Basic profile data is retained of the
Division of Geological and Geophysical Surveys and should be consulted
for detailed analysis.
