

Base from U.S. Geological Survey Craig B-3, 1940; B-4, 1940; Quadrangles, Alaska

LOCATION INDEX FOR SCALE 1:31,680

DESCRIPTIVE NOTES

KETCHIKAN SURVEY "Area 4" - March 1999
The geophysical data were acquired with a DIGHEM[®] Electromagnetic (EM) system and a Scintrex cesium magnetometer. Flights were conducted at a height of 100 feet. In addition the survey recorded data from a radar altimeter, GPS navigation system, 50/60 Hz monitors and video camera. Flights were performed with an AS350B-2 Squirrel helicopter or a mean terrain cleared aircraft of 200 feet along north-south flight lines one quarter mile apart. Tie lines were flown perpendicular to the flight lines at intervals of approximately 3 miles.

An Ashtech/Racal Real-Time Differential Global Positioning System (RT-DGPS) was used for both navigation and flight path recovery. The helicopter position was derived every 0.5 seconds using real-time differential positioning to a relative accuracy of better than 1 m. The survey data points were projected onto the Clarke 1866 (UTM zone 8) spheroid, 1927 North American datum using a central meridian (CM) of 135°, a north constant of 0 and an east constant of 500.00. Positional accuracy of the presented data is better than 10 m with respect to the UTM grid.

HETTA SURVEY "Area 3" - May 1999
The geophysical data were acquired with a DIGHEM[®] Electromagnetic (EM) system and a Scintrex cesium magnetometer. Flights were conducted for the magnetometer and EM system were approximately 213 and 164 feet, respectively. In addition the survey recorded data from a radar altimeter, UHF navigation system, 50/60 Hz monitors, VLF receiver and video camera. The east-west flight lines were flown one-eighth mile apart, with tie lines flown perpendicular to the flight lines. The survey was flown with an AS350B-1 helicopter.

A Del Norte H/F electronic positioning system was used for navigation. Flight path recovery was done with a combination of UHF data and visual recovery. Positional accuracy of the 1992 data should be considered of low reliability.

TOTAL FIELD MAGNETICS AND DETAILED ELECTROMAGNETIC ANOMALIES OF SELECTED AREAS NEAR KETCHIKAN, SOUTHEAST ALASKA

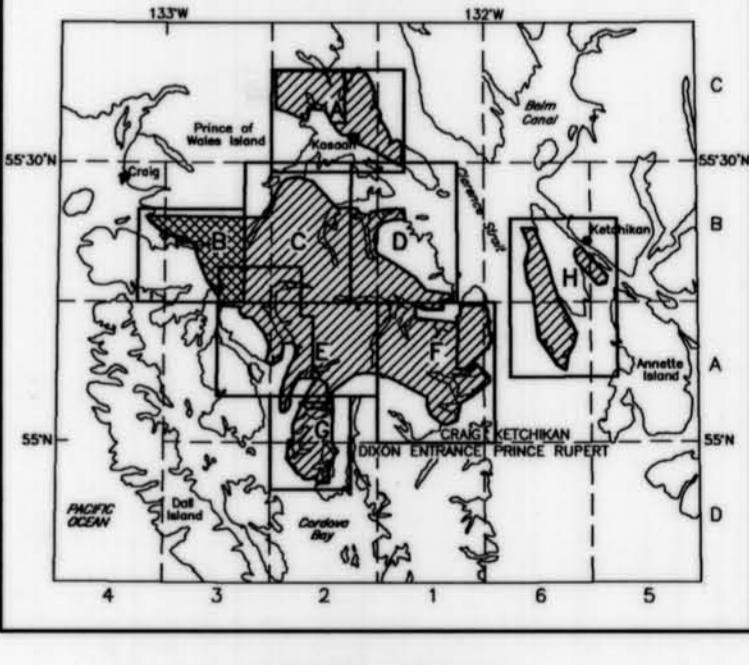

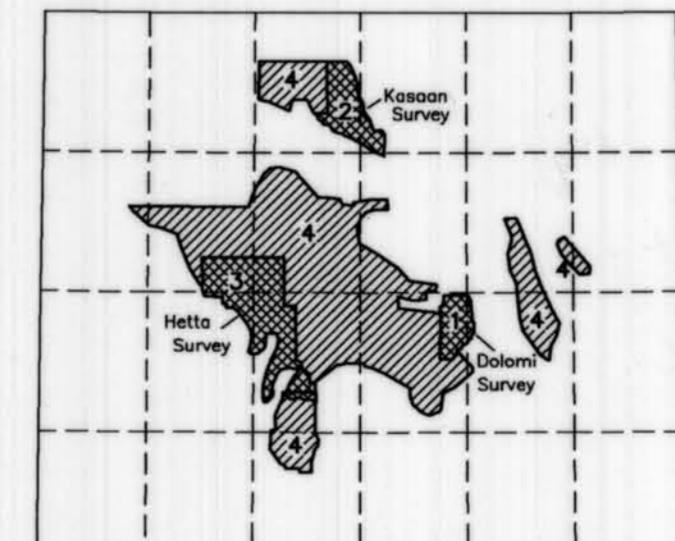

PARTS of CRAIG B-3 and
B-4 QUADRANGLES
1999

ELECTROMAGNETIC ANOMALIES

Symbol	Conductance
●	>100 siemens
●	50-100 siemens
●	20-50 siemens
●	10-20 siemens
●	5-10 siemens
●	1-5 siemens
●	<1 siemens
○	Questionable anomaly
△	EM magnetic response
○	Dip direction
○	Magnetic correlation in nT
○	Depth > 100 m
○	Arcs indicate the conductor has a thickness >10m
○	TRUE NORTH APPROXIMATE MEAN DECINATION, 1999

ELECTROMAGNETICS

To determine the location of EM anomalies or their boundaries, the DIGHEM[®] EM system measured inphase and quadrature components of five frequencies. Two vertical coaxial-coil pairs operated at 900 and 5500 Hz while three horizontal coplanar-coil pairs operated at 900, 7200, and 56,000 Hz. The data was sampled at 0.1 second intervals. The EM system responds to rock conductors, conductive overburden, and cultural sources. The type of conductor is indicated on the aeromagnetic map by the interpretive symbol attached to each EM anomaly. Determination of the type of conductor is based on EM anomaly shape, the inphase and coplanar-coil responses, together with conductor and magnetic patterns and topography. The power line monitor and the flight track video were examined to locate cultural sources.

SURVEY HISTORY

This map has been compiled and drawn under contract between the State of Alaska, Department of Natural Resources (DNR), Division of Geological and Geophysical Surveys (DGGS), and CGG, Mining & Geological Consultants, Inc. Airborne geophysical data for area 4 were acquired in 1999 by Geotekrex-Dighem, a division of CGG Caron, Inc., according to the project agreement with the U.S. Department of the Interior, Bureau of Land Management (BLM), Ketchikan Gateway Borough, Sealaska Corporation, Alaska State Mental Health Trust Land Office, and the cities of Thorne Bay and Coffman Cove. The data for areas 1, 2 and 3 were flown by Dighem in 1991 and 1992. These data were provided for publication by Sealaska Corporation.

This map and other products from this survey are available by mail order, or in person, from DGGS, 794 University Ave., Suite 200, Fairbanks, Alaska, 99709. Some products are also available, in person only, at the BLM's Juneau Minerals Information Center, Mayflower Island, Douglas, AK.

TOTAL FIELD MAGNETICS

The total field magnetic data were acquired with a sampling interval of 0.1 seconds, and were (1) corrected for diurnal variations by subtraction of the daily recorded base station magnetic data, (2) leveled to a reference line and (3) converted onto a regular 100 m grid using a modified Akima (1970) technique. The regional variation (or IGRF gradient, 1995, updated to March 1999) was removed from the leveled magnetic data.

Akima, H., 1970, A new method of interpolation and smooth curve fitting based on local procedures: Journal of the Association of Computing Machinery, v. 17, no. 4, p. 589-602.
