GEOTECHNICAL BOREHOLE AND WELL-LOG DATABASE FOR ANCHORAGE, ALASKA

R.A. Combellick, J.L. Mayer, K.D. Sink-Blair, and S.M. Weems
Alaska Division of Geological & Geophysical Surveys
2001

ABSTRACT

The Alaska Division of Geological & Geophysical Surveys has finished the compilation of subsurface geotechnical-borehole and well-log data for Anchorage, Alaska, in a Geographic Information System (GIS) database. Many private companies and government agencies contributed to this database. It contains downhole geologic or geotechnical data for more 2,500 boreholes and water wells, plus locations and reference information for an additional 1,700. We believe that the database is complete for geotechnical boreholes 50 ft or deeper and for available digital data from water wells 100 ft or deeper; data for many shallower holes are also included. When remaining issues of distribution formats and permissions are resolved with contributing organizations, nonproprietary data will be made available to the public in digital and hard-copy formats.

INTRODUCTION

The objectives of this 2-phase project are to (1) complete the compilation of geotechnical borehole data for Anchorage, Alaska, and make the nonproprietary data accessible to the public, (2) produce a detailed (1:25,000-scale) liquefaction-susceptibility map of Anchorage, and (3) produce a map of NEHRP¹-recommended seismic soil-types for Anchorage (also at 1:25,000 scale). The GIS database and resulting maps will be useful to engineers, developers, planners, and emergency managers in Anchorage for construction planning, site selection, structural design, and emergency-response planning. Our previous NEHRP-supported project (*Engineering-geology maps and cross sections of Anchorage, Alaska; award 1434-HQ-96-GR-02713*) resulted in compilation of more than 1,500 geotechnical borehole logs, 1,500 digital water-well logs, mostly for central and east Anchorage, and publication of a geologic map and seven cross sections for that area (Combellick, 1999). This is the final report for the first phase of this project, item (1) above. We have completed entry of the geotechnical data for west Anchorage, and have added many shallow boreholes and recently-drilled boreholes for the entire area. This completes the subsurface database for the entire Anchorage study area, including entry of downhole data for all known geotechnical boreholes deeper than 50 ft and all available digital well-log data for water wells deeper than 100 ft. Additionally, we have manually entered more than 200 shallow (<50 ft) boreholes and nondigital well-log data to supplement the database in areas of sparse coverage. Hundreds of shallow boreholes for which downhole data have not been entered are nonetheless located and indexed in GIS for rapid retrieval. The current status of data compilation is shown in Table 1. These data will be used to complete a simplified geologic map and cross sections for the entire city.

A complementary project is being conducted by the University of Alaska Geophysical Institute (UAGI) to collect and analyze seismic data for the purpose of generating seismic site-amplification maps. The project, *Seismic Microzonation of Metropolitan Anchorage* (Biswas, 1997), which is funded by the Alaska Council on Science and Technology, is making extensive

Seismic velocity	13	--	13
Static water level	799	1,271	2,070

*includes test pits and natural geologic exposures

use of subsurface data from this NEHRP project and, in turn, will provide important shear-wave velocity data that will be used along with standard penetration test data from the borehole database for the delineation of NEHRP seismic soil types. In phase 2 of the project, for which funding was recently awarded (USGS award 01HQGR0006), we will use the database to complete items (2) and (3) above (liquefaction-susceptibility map and seismic soil-type map). The seismic soil-type map is being prepared in cooperation with the UAGI to make optimum use of available shear-wave velocity data.

METHODS OF DATA COMPILATION

We obtained borehole and well-log data from the files of private geotechnical consulting firms and from federal, state, and local agencies (see Acknowledgments). Many of the reports obtained from private companies contain proprietary data because the drilling was performed under contract to private individuals or companies that have not released the data for public use. Under Alaska state law, we are authorized to retain as proprietary any data sets that the providing companies request to remain proprietary; these companies give the Alaska Division of Geological & Geophysical Surveys (DGGS) permission to use the data internally for interpretive purposes in preparing maps and reports but not permission to distribute the original data in any form.

Our goals were to compile not only sufficient data to prepare geologic cross sections, a liquefaction-susceptibility map, and seismic soil-type map, but to make provide nonproprietary subsurface data on request to researchers, planners, designers, and developers. We strived for a level of completeness that would include all known geotechnical boreholes of 50 ft and greater depth. Although not complete, we have also entered data for several hundred shallower boreholes to provide near-surface information where few deeper boreholes have been drilled.

Similarly, for water wells, manual entry of thousands of well logs was beyond the scope of this project. Therefore, our goal for water wells was to ensure completeness for all available digital well-log data from wells 100 ft and deeper. Although some wells were manually entered where needed and available, the bulk of the water-well database comes from the U.S. Geological Survey's digital Ground Water Site Index (GWSI). Unfortunately, because the GWSI database has not been maintained in recent years, these data are mostly pre-1988. Several more recent deep water wells, particularly in the downtown area and near Anchorage International Airport, have been manually entered.

We entered borehole data into a Microsoft Access database, which was linked to MapInfo GIS software through an open database connection (ODBC). The relational database in Access consists of the individual data tables listed in table 2. With the exception of median grain diameter, which is given in millimeters, all data are reported in English units because this is the system which, until very recently, has been used almost universally by geotechnical engineering organizations in the U.S.

Table 2 - Content of data tables in relational database. Not all data are available for all boreholes (see table 1).

<u>Table</u>	<u>Description</u>	<u>Key field(s)</u>	<u>Records</u>
Reports	Project information (organization, project number, report year, maximum borehole depth, where filed); one record per report or project	Project number (linked to Borehole)	671
Borehole	Index data (DGGS ID, project number, hole name, hole type, UTM location, location accuracy, reported elevation, date drilled, total depth, types of data entered); one record per borehole	Project number (linked to Reports), DGGS ID (linked to all other tables)	4,479*
Lithology	Lithologic logs (DGGS ID, depth to top, depth to bottom, lithologic description, unified soil class); one record per layer	DGGS ID (linked to Borehole)	15,392
SPT data	Standard penetration test data (DGGS ID, depth to top, depth to bottom, material type, blows/ft, sample diameter, hammer weight, drop distance); one record per test	DGGS ID (linked to Borehole)	8,982
Sample Test	Laboratory analytical data (DGGS ID, depth to top, depth to bottom, unit weight, dry density, moisture content, liquid limit, plastic limit, plasticity index, median grain diameter, percent gravel, percent fines, percent clay); one record per sample	DGGS ID (linked to Borehole)	5,680
Water level	Measured water level (DGGS ID, date measured, depth to water, comments); one record per measurement	DGGS ID (linked to Borehole)	2,152
Velocity	Seismic velocity (DGGS ID, depth to top of interval, depth to bottom of interval, shear-wave velocity); one record per interval	DGGS ID (linked to Borehole)	164

*includes 237 boreholes for which only a location and an identifier are recorded

Borehole Records

With the exception of digital well logs, for which geographic positions were provided, all borehole locations were digitized in GIS from project site maps provided with the drilling reports. The scale and detail of these site maps are highly variable, resulting in some variation in accuracy of the digitized locations. The borehole location, in Universal Transverse Mercator (UTM) coordinates, was recorded in the Borehole header record in the database (see table 2), along with a code indicating relative accuracy. In addition to the reported elevation, if any, a corrected elevation was derived from the digital elevation model (DEM), based on the borehole's location in GIS. This corrected elevation was derived for every borehole except those in areas where artificial fill had been emplaced after the drilling date and before the issue date of the topographic map on which the DEM was based. The purpose of including the DEM elevations was to enable automated placement of the borehole logs on a cross-section view in their correct positions relative to the surface topography.

The DEM elevations helped identify erroneous locations or elevations recorded in the digital water-well data as obtained from USGS Ground Water Site Inventory. By obtaining original well logs, we determined that where a reported elevation differed significantly from the DEM elevation, it was usually because the location was in error, most often by one township (6 mi).

After digitizing the hole location in GIS and automatically recording the UTM coordinates in the Borehole table, other general information about the borehole or well was also recorded in the Borehole record (see table 2). The original hard-copy borehole data are retrievable through a link to the Reports records provided by the project number. Original reports are organized by Municipality of Anchorage grid square number.

Lithology records

The most basic geotechnical information entered for each borehole is the stratigraphic description, or lithologic log. For more than half of the geotechnical boreholes, the lithologic log is the only type of data available (see table 1). However, for every borehole for which any other data are recorded (sample analyses, penetration data, etc.), there is also a lithologic log in the database. Lithologic logs were entered verbatim, one data record per layer, except that technical details of the drilling process were excluded, as were codes regarding the frozen versus unfrozen state and frost susceptibility of the material. In a few cases, lithologic logs consisted only of individual sample descriptions. In these cases, we subdivided the logs into logical stratigraphic layers, estimated the depths of stratigraphic contacts, and wrote composite descriptions from the sample descriptions.

SPT data records

Although procedures for the standard penetration test are prescribed by the American Society for Testing and Materials (ASTM, 2001), methods of reporting the results vary widely among different organizations. Because this database provides a capability for providing penetration data from multiple sources for analytical purposes, such as evaluating the susceptibility of an area to earthquake-induced liquefaction, we devoted considerable effort to ensuring consistency of data reporting and excluding tests that did not appear to conform to the ASTM standard.

The standard penetration test consists of driving a 2.0-in outside diameter (O.D.) split-spoon sampler with a 140-lb weight that is repeatedly dropped from a height of 30 in. Two purposes are achieved during the test: collecting a sediment sample and determining the penetration resistance of the material. The driller counts the number of blows required to drive the sample each 6-in. interval for a total of 18 in. The reported penetration resistance, or blow count, is the sum of blows for the second and third 6-in. intervals. Because some penetration tests are made with

larger samplers (typically 3-in. O.D.) and heavier hammers (typically 340 lb), we recorded the sampler size, hammer weight, and drop distance for each test.

In most reports, the test result was given in blows per foot. In others, the blow count was reported as the driller recorded it for each 6-in. or, in a few cases, 3-in. interval. In these latter cases, we calculated the blow counts from the given data so that all values we recorded in the database represented the sum of blows in the second and third 6-in. intervals as required by the ASTM standard. From the lithologic or textural data, we also recorded material characteristics for each test that are significant for interpreting the penetration value: predominantly sand with minor gravel, high gravel content, predominantly silt or clay, or high organic content. For many, but not all tests, grain-size data are also available in the sample test records.

For many split- spoon sampling intervals, the penetration test was incomplete. The driller stopped the count because of very hard material or refusal, or the material was so soft that the sampler penetrated it with a single blow or under the weight of the drill stem with no blows required; an ‘easy push’ condition. In the case of very hard material, the driller may have recorded a high blow count but not for the standard 12-in. interval of an 18-in. test. The recorded number may have been for only for the first few inches of penetration. Although the reported value is not a standard value according to the ASTM standard, we did not wish to disregard the test because knowing the relative hardness of the material is important information for interpreting its engineering characteristics. Similarly, we did not wish to discard ‘easy push’ information or very low blow counts because they give important information about the softness of the material. To accommodate both types of data, we developed a decision tree (fig. 1) to allow

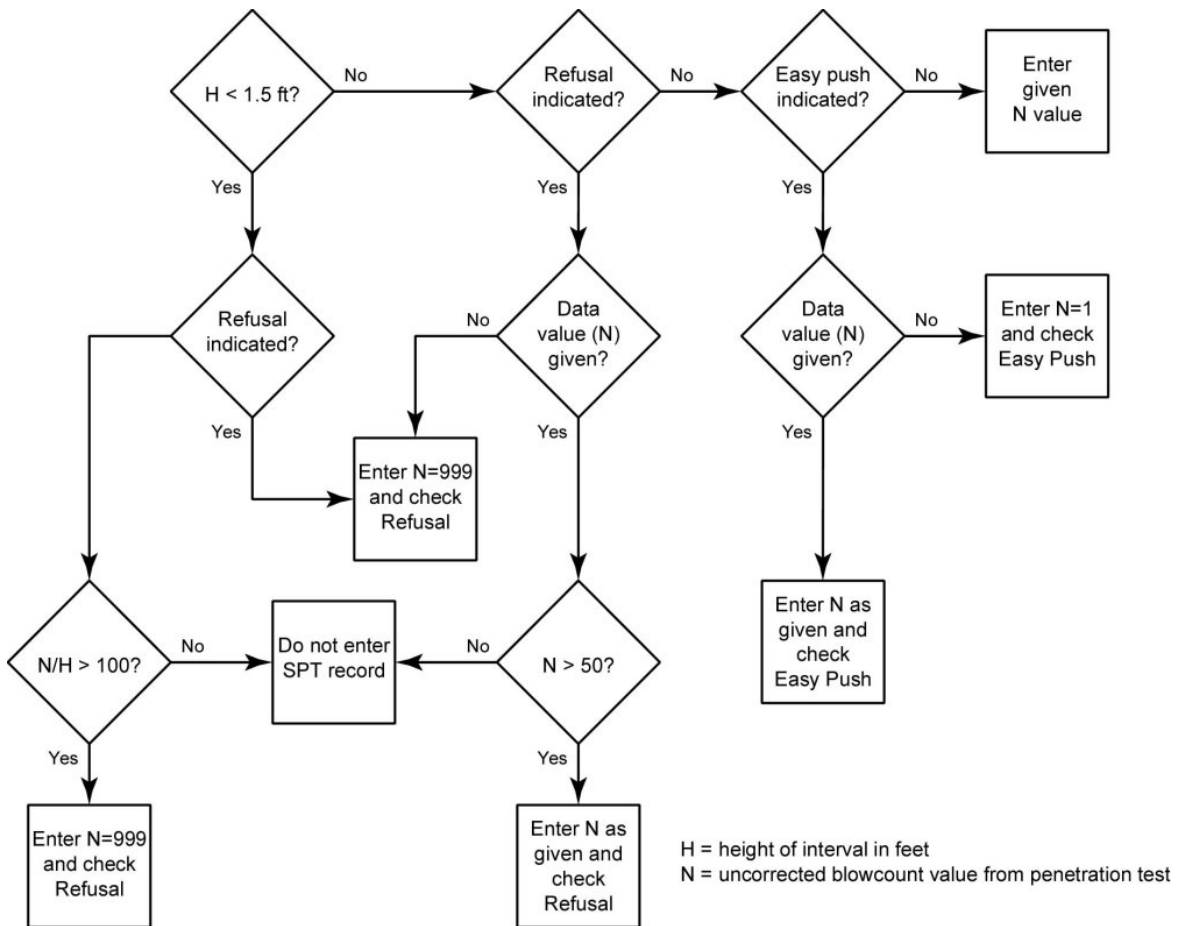

Figure 1 - Decision tree for entering standard penetration test data.

for consistent reporting of data for both very hard and very soft materials. Among other uses, this allows the data to be used to develop graphical displays of penetration resistance with depth that convey information about the relative hardness of the material.

Although use of the decision tree resulted in some data for soft or hard materials being discarded because of ambiguous reporting, the remaining data that could not be reported in terms of standard blow counts according to ASTM were given either a value of 1, for easy push condition, or 999, for very hard or refusal condition.

Sample test records

We recorded laboratory analytical data for individual samples where available. Data most commonly available included grain-size distribution, moisture content, Atterberg limits, and either wet unit weight or dry density. Each of these analyses is associated with a sample for which depth to top and depth to bottom were recorded in the database.

Grain-size data were typically obtained from sieve analyses and presented either in tabular or graphic form showing cumulative weight percent passing. Rather than attempting to record the entire analysis, we recorded percent gravel (retained on no. 4 sieve), percent fines (passing no. 200 sieve), and percent clay (portion of fines smaller than 0.005 mm) where available. The user can calculate percent sand by subtracting from 100 the total percent gravel and fines. If the data were presented graphically, we also determined and recorded the median grain diameter in millimeters (diameter at which the curve crosses the 50-percent line; half of the sample by weight is coarser or finer than this diameter).

We recorded moisture content only if Atterberg limits or density data were also provided. Atterberg limits (liquid limit and plastic limit) were recorded as given. Plasticity index was calculated automatically as the difference between liquid and plastic limits. For some samples, more than one Atterberg limit test was performed and recorded.

Wet unit weight or bulk density values are not commonly provided but were recorded where available. From all available data sources, density values are given in pounds per cubic foot. If wet unit weight was not given but dry density and moisture content were provided, we used a macro to automatically calculate and enter the wet unit weight, γ_w , using the formula $\gamma_w = \gamma_d(1+w)$, where γ_d is the dry density and w is the fractional moisture content (Lambe and Whitman, 1969).

For a small fraction of samples, other data are given such as shear strength and sensitivity. Because of the wide variety of methods used to determine these values, we did not feel confident in including them in this database. These analyses may be added at a later date.

Water level records

We recorded depth to water wherever reported in a borehole or well log. In a few cases, more than one depth was recorded because the measurement was made at different times, such as one while drilling and one after drilling. Recorded data include date of measurement, depth to water, and, where provided, any comments regarding conditions or timing of the measurement.

Velocity records

Continuous downhole shear-wave velocity measurements were available for 13 boreholes in the Anchorage area. Each data record contains depth to top of interval, depth to bottom of interval, and reported shear-wave velocity in feet per second.

INDEX MAP AND TABLE

Sheet 1 shows locations, hole types, and total depths of all boreholes and well logs in the database. Also shown on this map is the Municipality of Anchorage grid system, which divides the city into numbered quarter-sections that are 0.5 mi by 0.5 mi square. We used GIS to automatically determine the grid number for each borehole and to record these numbers in the borehole records. All original hard-copy data reports are filed by this number to facilitate retrieval. In areas where there are no assigned grid squares, we determined the grid numbers by extrapolating the municipality's numbering system.

Table 3 (in .pdf and .xls formats on 3.5-in. diskette) provides DGGS number, hole type, date completed, location, total depth, and types of data entered for all holes in the database, sorted by Municipality of Anchorage grid number. Locations are given in UTM coordinates, for which U.S. Geological Survey standard topographic maps show reference marks along the margins. Date completed is provided where available. Where only the month and year are given in the original data, the first of the month is used. If only the year is known, we entered the date as January 1.

DATABASE MAINTENANCE AND AVAILABILITY

DGGS maintains the Anchorage geotechnical database on a desktop computer and generates backups each time it is modified. We will continue to update the database as more data become available, and will enter additional data from existing hard-copy records as needed. As of this writing, we are negotiating with the original providers regarding what data can be released to the public, what data should be released only in original hard-copy form, and what data must remain proprietary. Data requests should be directed to the senior author. We invite organizations to submit any subsurface geotechnical data for the Anchorage area, regardless whether new or old, for inclusion in the database.

ACKNOWLEDGMENTS

We gratefully acknowledge the contributions of geotechnical and well-log data from the following organizations:

Alaska Department of Transportation & Public Facilities
Dames & Moore
