Gazetteer of the Gulf of Alaska	
Subregion I - East Gulf Coast	12
Subregion II - Prince Williams Sound	22
Subregion III - West Gulf Coast	32
Subregion IV - Alaska Peninsula	40
Subregion V - Gulf of Alaska, North of 58°N	58
Subregion VI - Northeast Pacific, 54°N to 58°N	60

Introduction

This gazetteer, the first of three to be released, presents names of sea-floor features of the Gulf of Alaska and coastal features north of 54° N latitude between Cross Sound to the east and Unimak Island to the west. Also included are Prince William Sound and Cook Inlet but not the fiords, channels, and shoreline of southeast Alaska that make up the "Inside Passage" and Alexander Archipelago.

All of Alaska has been divided into three major regions: Region 1 - Gulf of Alaska; Region 2 - Bering Sea; and Region 3 - Arctic Seas (Fig. 1). This gazetteer is comprised of the features within Region 1 and has been divided into subregions that roughly conform to commonly designated research areas; the listings in the gazetteer are thus grouped together by subregion. The subregions for the Gulf of Alaska are: 1) the East Gulf Coast, from Cross Sound to Point Barrow; 2) Prince William Sound; 3) the West Gulf Coast, the Kenai Peninsula and Cook Inlet from Cape Puget to Cape Douglas; 4) the Alaska Peninsula, from Cape Douglas to Isanotski Strait, and Kodiak Island; 5) the Gulf of Alaska, north of 58° ; and 6) the northern Pacific, from 54° N to 58° N (Fig. 2).

Within the gazetteer individual listings occupy six columns. The first column lists the name of the specific place or feature. Column two describes the type of feature e.g. glacier, estuary, or stream among others. The third grouping presents the geographical coordinates for the feature in degrees, minutes, and seconds e.g. $59^{\circ}56'00''N139^{\circ}32'15''W$. The fourth and fifth columns designate the geographic region and subregion of each feature.

The sixth column provides three additional items of information. The first space has a "Y" or "N", yes or no, indicating if there is another feature that has the same name in Alaska. The second space has another "Y" or "N" indicating

Coastal and Offshore Regions of Alaska

Figure 1.

Subregions of the Gulf of Alaska

Figure 2.

whether or not the name has been approved by the U.S. Board of Geographic Names. The last two spaces are a reference code that is keyed to the source publication listed on page 11.

The designations used in the gazetteer such as island, glacier, marine bank, or seavalley follow the format used by Orth (1967) in the "Dictionary of Alaska Place Names" and the Central Intelligence Agency's (1969) "Official Standard Names of Undersea Features". A list of these terms, modified by the authors to fit Alaskan morphology, is found in the Glossary on page 4. Geographic coordinates have also been obtained from both of these sources. New listings have been given designations to conform to the terms in the Glossary. New geographic coordinates have been plotted from the best map source available.

The purpose of the Gulf of Alaska gazetteer is to list the named features of the region and their location so that marine scientists can have a standard nomenclature to use when discussing this vast geographic area. Operations related to offshore oil have greatly increased the activity both onshore and offshore necessitating new or updated coastal maps and charts. Many new features are delineated on these new or revised charts and maps. Another purpose of the gazetteer is to minimize confusion and multiple naming of Gulf of Alaska features by presenting as complete a catalog of existing names as possible. Annual or biannual updates of new names, keeping pace with mapping and research, is the ultimate goal.

GLOSSARY

- BAR** - a generic term for any of various elongate offshore ridges, banks, or mounds of sand, gravel, or other unconsolidated material, submerged at least at high tide, and built up by the action of waves or currents on the water bottom especially at the mouth of a river or estuary, or at a slight distance from the beach. The term also applies to deposits in river systems of similar shape which result from periods with significantly different discharges.
- BARRIER BEACH** - a single, narrow, elongate sand ridge rising slightly above the high-tide level and extending generally parallel with the shore, but separated from it by a lagoon or marsh; it is extended by longshore drifting and is rarely more than several kilometers long. See also: barrier island.
- BARRIER ISLAND** - a long, low, narrow, wave-built sandy island representing a broadened barrier beach that is sufficiently above high tide and parallel to the shore, and that commonly has dunes, vegetated zones, and swampy terranes extending landward from the beach. Also a long series of barrier beaches.
- BASIN** - a depression of the sea floor more or less equidimensional in form and of variable extent.
- BAY** - a large indentation of a sea or lake into the land. A bay is as long or longer than it is wide; its width is at least 2 kilometers, as opposed to the width of a cove.
- BEACH** - a gently sloping part of a shore that is washed by waves or tides and is generally covered by sand or gravel.

BIGHT - a wide gentle curve or indentation of a coast, commonly between two headlands; unlike a bay or cove, the length across its mouth is greater than the length of the indentation into the coast.

BLUFF - a high broad-faced bank or cliff.

CANAL - a manmade watercourse constructed and maintained primarily for navigation.

CANYON - a relatively narrow, deep depression with steep slopes, the bottom of which grades continuously downward.

CHANNEL - a deep part of a bay, stream, or strait frequently used as a route for ships.

COASTAL PLAIN - any lowland area bordering a sea or ocean, extending inland to the nearest elevated land, and sloping very gently seaward; it may result from the accumulation of material.

CONTINENTAL RISE - that part of the continental margin that is between the continental slope and the abyssal plain, except in areas of an oceanic trench. It is a gentle incline with slopes of 1:40 to 1:2000, and generally smooth topography, although it may bear submarine canyons.

CONTINENTAL SHELF - that part of the continental margin that is between the shoreline and the continental slope (or, when there is no noticeable continental slope, a depth of 200 m). The slope of the shelf is usually very gentle (0.1°).

CONTINENTAL SLOPE - that part of the continental margin that is between the continental rise (or oceanic trench). The slope of the continental slope is steep (3° - 6°).

COVE - a small bay or indentation along the edge of a larger body of water. Like a bay, it is as long or longer than it is wide; its width is less than 2 kilometers, as opposed to the width of a bay.

DELTA - low-lying alluvial deposits at the mouth of a stream over which distributaries of the main stream often flow.

DISTRIBUTARY - a branch of a stream flowing away from the original stream and not rejoining it; generally on a delta.

ESCARPMENT - a nearly continuous line of cliffs or steep slopes facing in one general direction.

ESTUARY - the lower course of a stream or former glacier which has been drowned by a relative rise in sea level and within which the tide ebbs and flows; an inlet or arm of the sea where the tide meets the current at the mouth of a stream. Most Alaskan estuaries are fiords.

FAN - a gently sloping, semi-conical shaped feature normally located near the lower termination of a canyon.

FILLED BAY - a sedimented area, now part of the coastal plain, which in historic time was an open body of water. Sedimentation was the result of fluvial, glacial, or marine deposition.

FRACTURE ZONE - an extensive linear zone of unusually irregular topography of the sea floor characterized by large seamounts, steep-sided or asymmetrical ridges, troughs, or escarpments.

GAP - a steep-sided depression cutting transversely across a ridge or rise.

GLACIER - a mass of ice moving outward and downslope from an area of accumulation.

GULF - a very large indentation of the sea into the land - much larger than a bay.

GUYOT - a seamount having a comparatively smooth flat top.

HILL - a prominent elevation of less than 300 meters.

ICEFIELD - extensive area of permanent ice. Normally, the source area of most glaciers.

ISLAND - an area of dry or normally dry land entirely surrounded by water.

ISLAND CHAIN - a group of islands in fairly close proximity to each other and extending along a line.

KNOLL - an elevation rising less than 1,000 meters from the sea floor and of limited extent across the summit.

LAGOON - a body of water cut off from a larger body of water by a barrier beach, barrier island, reef, or bar.

LAKE - any standing body of inland water.

MARINE BANK - an elevation of the sea floor located on a continental (or island) shelf and over which the depth of water is relatively shallow but sufficient for safe surface navigation.

MARINE ESCARPMENT - an elongated and comparatively steep slope of the sea floor, separating flat or gently sloping areas.

MOAT - an annular depression that may not be continuous, located at the base of many seamounts or islands.

PENINSULA - a fairly narrow body of land nearly surrounded by water and connected on one side to a larger body of land.

PLAIN - a flat, gently sloping or nearly level region of the sea floor.

PLATEAU - a comparatively flat-topped elevation of the sea floor of considerable extent across the summit and usually rising more than 200 meters on all sides.

POINT OF LAND - a protuberance of land along the shore of a lake, river, or sea or along the side of a hill, mountain, or ridge, or glacier; a projecting or tapering piece of land.

PROMONTORY - a projection, headland, or cliff protruding into the sea, commonly with offshore rocks.

PROVINCE - a region composed of a group of similar bathymetric features whose characteristics are markedly in contrast with surrounding areas.

REEF - a narrow chain, range, or ridge of rocks, especially coral and sometimes sand, gravel or shells, elevated above the surrounding bottom of the sea, lying at or near the surface of the water and sometimes visible at low tide.

RIDGE - a long, narrow elevation of the sea floor with steep sides and irregular topography.

RISE - a long, broad elevation that rises gently and generally smoothly from the sea floor,

ROCK(S) - boulders or a continuous outcrop, visible or exposed at low tide along the coast or in rivers and lakes.

SEA - large open body of saline water.

SEACHANNEL - a long, narrow, U-shaped or V-shaped shallow depression of the sea floor, usually occurring on a gently sloping plain or fan.

SEAMOUNT - an elevation rising 1,000 meters or more from the sea floor, and of limited extent across the summit.

SEAMOUNT CHAIN - several seamounts in a line with bases separated by a relatively flat sea floor.

SEAMOUNT GROUP - several closely spaced seamounts not in a line.

SEAMOUNT RANGE - several seamounts having connected bases and aligned along a ridge or rise.

SEAVALLEY - a general term used to describe any elongate depression cutting across the continental margin. The term does not imply any process in the origin of the depression whereas strath implies a glacial origin and a characteristic longitudinal profile, and submarine canyon implies a fluvial marine erosional system coupled with lowered sea level.

SHOAL - a shallow area in a sea, river, or lake.

SPIT - a long, narrow accumulation of sand or gravel attached to the land and projecting into a sea, bay, or lake.

SPUR - a subordinate elevation, ridge, or rise projecting outward from a larger feature..

STRATH - an elongate, broad, and steep-sided depression on the continental shelf, usually glacial in origin. It is often deeper on its nearshore side.

Note: Much confusion exists in the use of strath, seavalley, and submarine canyon. These terms have been used interchangeably although they do not describe identical features.

STREAM - a body of water flowing overland; it includes creek, distributary, river, and slough.

SUBMARINE CANYON - a steep-sided, generally V-shaped valley cutting across the continental shelf or slope and generally ending on the abyssal plain.

Most submarine canyons head near river mouths and may be related to fluvial down cutting of the shelf during eustatically lowered sea level. Note: much confusion exists in the use of submarine canyon, strath, and seavalley.

These terms have been used interchangeably although they do not describe identical features.

TERRACE - a bench-like structure bordering an undersea feature.

TRENCH - a narrow, elongate depression of the deep-sea floor, with steep sides and oriented parallel to the trend of the continent and between the continental margin and the abyssal hills. Such a trench is about 2 km deeper than the surrounding ocean floor and may be thousands of kilometers long.

TROUGH - a long depression of the sea floor, normally wider and shallower than a trench, with less steeply dipping sides.

VALLEY - a relatively shallow, wide depression with gentle slopes, the bottom of which grades continuously downward. This term is used for features that do not have canyon-like characteristics in any significant part of their extent.

WATER PASSAGE - a coastal waterway connecting bodies of open water or other passages; it includes inlets to lagoons and channels between islands.
