GAZETTEER OF COASTAL AND OFFSHORE FEATURES
OF THE BERING SEA AND ALEUTIAN ARC

By

Marybeth Gerin

Open-File Report 79-1219

U. S. Geological Survey
OPEN FILE REPORT

This report is preliminary and has
not been edited or reviewed for
conformity with Geological Survey
standards and nomenclature.

TABLE OF CONTENTS

Introduction	1
Glossary	4
Reference List	10
Gazetteer of the Bering Sea and Aleutian Arc	
Subregion I - Aleutian Islands and Trench	11
Subregion II - Bering Sea Coast	31
Subregion III - Bering Sea	47

Introduction

This gazetteer presents the names of seafloor and coastal features of the Bering Sea and Aleutian Arc. It is the second of three gazetteers that cover the offshore and coastal features of Alaska. Alaska was divided into three major regions - the Gulf of Alaska (Gerin and Molnar, 1978), the Bering Sea and Aleutian Arc, and the Arctic Seas. (Fig. 1) The Bering Sea was divided further into subregions, and the named features are grouped together by subregions. The subregions for the Bering Sea are: 1) the Aleutian Islands from Unimak to Attu, including the features of the slope and trench; 2) the Bering Sea coast from Isanotski Strait on the Alaska Peninsula north to the Bering Strait, including Nunivak and Saint Lawrence Islands; and 3) the Bering Sea, offshore features from the Aleutian Islands to the Bering Strait. (Fig. 2)

The purpose of the gazetteer is to serve as a collection of named features of the region, both current and new names. This gazetteer provides a single source of names for coastal and offshore features rather than separate land and sea references. With the increased activity of offshore exploration there is an increased use of current and new names in reports and maps of the Bering Sea.

Individual names in the gazetteer occupy seven columns. The first column lists the name of the specific place or feature. Column two describes the type of feature, e.g. glacier, estuary, or stream. The third grouping presents the geographic coordinates (longitude and latitude) for the features in degrees, minutes, and seconds, e.g. 59°56'00"N 139°32'15"W. The fourth and fifth columns

Coastal and Offshore Regions of Alaska

Subregions of the Bering Sea

1. Aleutian Islands and Trench
2. Bering Sea Coast
3. Bering Sea

Figure 2

designate the geographic region and subregion of each feature. The sixth column states whether or not the name has been approved by the United States Board on Geographic Names. The last column has a two figured reference code that is keyed to the source publication listed on page 10.

Designations used in the gazetteer such as island, glacier, or marine bank follow definitions used by Orth (1967) in the "Dictionary of Alaska Place Names", United States Board on Geographic Names (1971) in the "Undersea Features, Official Standard Names, Second Edition", or the "Glossary of Geology" (1972). A complete glossary is found on page 4. Geographic coordinates have also been obtained from these first two sources. New names have been given designations to conform to terms in the compiled glossary. New geographic coordinates have been plotted on the best map source available.

It is not the intended purpose of this gazetteer to imply approval or disapproval of the names listed. If a name has been approved by the United States Board on Geographic Names, it is indicated in column six. When contemplating naming a feature in Alaska, it is urged that the name be submitted to the Board. The Board will also provide assistance with any problem regarding the name of an Alaskan feature.

GLOSSARY

ARCH - a broad, open fold of a regional scale; it is usually a basement doming.

BAR - a generic term for any of various elongate offshore ridges, banks, or mounds of sand, gravel, or other unconsolidated material, submerged at least at high tide, and built up by the action of waves or currents on the water bottom especially at the mouth of a river or estuary, or at a slight distance from the beach. The term also applies to deposits in river systems of similar shape which result from periods with significantly different discharges.

BARRIER BEACH - a single, narrow, elongate sand ridge rising slightly above the high-tide level and extending generally parallel with the shore, but separated from it by a lagoon or marsh; it is extended by longshore drifting and is rarely more than several kilometers long. See also barrier island.

BARRIER ISLAND - a long, low, narrow, wave-built sandy island representing a broadened barrier beach that is sufficiently above high tide and parallel to the shore, and that commonly has dunes, vegetated zones, and swampy terranes extending lagoonward from the beach. Also a long series of barrier beachers.

BASIN - a more or less equidimensional depression of the sea floor.

BASIN - (subbottom basin) a general term for a depressed, sediment-filled area.

BAY - a large indentation of a sea or lake into the land. A bay is as long or longer than it is wide; its width is at least 2 kilometers, as opposed to the width of a cove. See also: bight, gulf.

BEACH - a gently sloping part of a shore that is washed by waves or tides and is generally covered by sand or gravel.

BIGHT - a wide gentle curve or indentation of a coast, commonly between two headlands; unlike a bay or a cove, the length across its mouth is greater than the length of the indentation into the coast. See also: bay, cove.

BLUFF - a high broad-faced bank or cliff.

CANAL - a manmade watercourse constructed and maintained primarily for navigation.

CANYON - a relatively narrow, deep depression with steep slopes, the bottom of which grades continuously downward.

CHANNEL - a deep part of a bay, stream, or strait frequently used as a route for ships.

COASTAL PLAIN - any lowland area bordering a sea or ocean, extending inland to the nearest elevated land, and sloping very gently seaward; it may result from the accumulation of material.

CONTINENTAL RISE - that part of the continental margin that is between the continental slope and the abyssal plain, except in areas of an oceanic trench. It is a gentle incline with slopes of 1:40 to 1:2000, and generally smooth topography, although it may bear submarine canyons.

CONTINENTAL SHELF - that part of the continental margin that is between the shoreline and the continental slope (or, when there is no noticeable continental slope, a depth of 200m). The slope of the shelf is usually very gentle (0.1°).

CONTINENTAL SLOPE - that part of the continental margin that is between the continental rise (or oceanic trench). The slope of the continental slope is steep (3° - 6°).

COVE - a small bay or indentation along the edge of a larger body of water. Like a bay, it is as long or longer than it is wide; its width is less than 2 kilometers, as opposed to the width of a bay. See also: bay, bight.

DELTA - low-lying alluvial deposits at the mouth of a stream over which distributaries of the main stream often flow.

DISTRIBUTARY - a branch of a stream flowing away from the original stream and not rejoining it; generally on a delta.

ESCARPMENT - a nearly continuous line of cliffs or steep slopes facing in one general direction.

ESTUARY - the lower course of a stream or former glacier which has been drowned by a relative rise in sea level and within which the tide ebb and flows; an inlet or arm of the sea where the tide meets the current at the mouth of a stream. Most Alaskan estuaries are fiords.

FAN - a gently sloping, semi-conical shaped feature normally located near the lower termination of a canyon.

FILLED BAY - a sedimented area, now part of the coastal plain, which in historic time was an open body of water. Sedimentation was the result of fluvial, glacial, or marine deposition.

FIORD - a long, narrow, winding, U-shaped and steep-walled, generally deep inlet or arm of the sea between high rocky cliffs or slopes along a mountainous coast, typically with a shallow sill or threshold of solid rock or earth material submerged near its mouth, and becoming deeper far inland; it usually represents the seaward end of a deeply excavated glacial-trough valley that is partially submerged by drowning after the melting of the ice.

FRACTURE ZONE - an extensive linear zone of unusually irregular topography of the sea floor characterized by large seamounts, steep-sided or asymmetrical ridges, troughs, or escarpments.

GAP - a steep-sided depression cutting transversely across a ridge or rise.

GLACIER - a mass of ice moving outward and downslope from an area of accumulation.

GULF - a very large indentation of the sea into the land - much larger than a bay.

GUYOT - a seamount having a comparatively smooth flat top.

HILL - a prominent elevation of less than 300 meters.

ICEFIELD - an extensive area of permanent ice. Normally, the source area of most glaciers.

ISLAND - an area of dry or normally dry land entirely surrounded by water.

ISLAND CHAIN - a group of islands in fairly close proximity to each other and extending along a line.

KNOLL - an elevation rising less than 1,000 meters from the sea floor and of limited extent across the summit.

LAGOON - a body of water cut off from a larger body of water by a barrier beach, barrier island, reef or bar.

LAKE - any standing body of inland water.

MARINE BANK - an elevation of the sea floor located on a continental (or island) shelf and over which the depth of water is relatively shallow but sufficient for safe surface navigation.

MARINE ESCARPMENT - an elongated and comparatively steep slope of the sea floor, separating flat or gently sloping areas.

MOAT - an annular depression that may not be continuous, located at the base of many seamounts or islands.

MOUTH - the place of discharge of a body of water into a larger body of water.

PENINSULA - a fairly narrow body of land nearly surrounded by water and connected on one side to a larger body of land.

PINGO - a frost mound, especially a relatively large conical mound of soil-covered ice raised by hydrostatic pressure of water within or below the permafrost of Arctic regions, and of more than one year duration.

PLAIN - a flat, gently sloping or nearly level region of the sea floor.

PLATEAU - a comparatively flat-topped elevation of the sea floor of considerable extent across the summit and usually rising more than 200 meters on all sides.

POINT OF LAND - a protuberance of land along the shore of a lake, river, or sea or along the side of a hill, mountain, or ridge, or glacier; a projecting or tapering piece of land.

PROMONTORY - a projection, headland, or cliff protruding into the sea, commonly with offshore rocks.

PROVINCE - a region composed of a group of similar bathymetric features whose characteristics are markedly in contrast with surrounding areas.

REEF - a narrow chain, range, or ridge of rocks, especially coral and sometimes sand, gravel, or shells, elevated above the surrounding bottom of the sea, lying at or near the surface of the water and sometimes visible at low tide.

RIDGE - a long, narrow elevation with steep sides and irregular topography.

RISE - a long, broad elevation that rises gently and generally smoothly from the sea floor.

ROCK(S) - boulders or a continuous outcrop, visible or expected at low tide along the coast or in rivers and lakes.

SAND DUNE - a dune consisting of loose sand piled or heaped up by the wind.

SEA - a large open body of saline water.

SEACHANNEL - a long, narrow, U-shaped or V-shaped, shallow depression of the sea floor, usually occurring on a gently sloping plain or fan.

SEAMOUNT - an elevation rising 1,000 meters or more from the sea floor, and of limited extent across the summit.

SEAMOUNT CHAIN - several seamounts in a line with bases separated by a relatively flat sea floor.

SEAMOUNT GROUP - several closely spaced seamounts not in a line.

SEAMOUNT RANGE - several seamounts having connected bases and aligned along a ridge or rise.

SEAVALLEY - a general term used to describe any elongate depression cutting across the continental margin. The term does not imply any process or the origin of the depression whereas strath implies a glacial origin and a characteristic longitudinal profile, and submarine canyon implies a fluvial marine erosional system coupled with lowered sea level.

SHOAL - a shallow area in a sea, river, or lake.

SLOPE - the inclined surface of any part of the Earth's surface; also, a broad part of a continent descending toward an ocean.

SOUND - a long, large rather broad inlet of the ocean generally extending parallel to the coast.

SPIT - a long, narrow accumulation of sand or gravel attached to the land and projecting into a sea, bay, or lake.

SPUR - a subordinate elevation, ridge, or rise projecting outward from a larger feature.

STRATH - an elongate, broad, and steep-sided depression on the continental shelf, usually glacial in origin. It is often deeper on its nearshore side. Note: Much confusion exists in the use of strath, seavalley, and submarine canyon. These terms have been used interchangeably although they do not describe identical features.

STREAM - a body of water flowing overland; it includes creek, distributary, river, and slough.

SUBMARINE CANYON - a steep-sided, generally V-shaped valley cutting across the continental shelf or slope and generally ending on the abyssal plain. Most submarine canyons head near river mouths and may be related to fluvial down cutting of the shelf during eustatically lowered sea level. Note: Much confusion exists in the use of submarine canyon, strath, and seavalley. These terms have been used interchangeably although they do not describe identical features.

TERRACE - a bench-like structure bordering an undersea feature.

TIDAL FLAT - an extensive, nearly horizontal, marshy or barren stretch of land that is alternately covered and uncovered by the rise and fall of the tide, and consisting of unconsolidated sediment (mostly mud and sand).

TRENCH - a narrow, elongate depression of the sea floor, with steep sides and oriented parallel to the trend of the continent and between the continental margin and the abyssal hills. Such a trench is about 2 kilometers deeper than the surrounding ocean floor and may be thousands of kilometers long.

TROUGH - a long depression of the sea floor, normally wider and shallower than a trench, with less steeply dipping sides.

VALLEY - a relatively shallow, wide depression with gentle slopes, the bottom of which grades continuously downward. This term is used for features that do not have canyon-like characteristics in any significant part of their extent. Note: Much confusion exists in the use of valley and submarine canyon, strath, and seavalley. These terms have been used interchangeably although they do not describe identical features.

WATER PASSAGE - a coastal waterway connecting bodies of open water or other passages; it includes inlets to lagoons and channels between islands.

WATER COURSE - a natural or manmade channel through which water flows.
