

Virtual Watersheds in Alaska

*Lee Benda, Daniel Miller
Kevin Andras, TerrainWorks*

End Users Questions--Applications

- Are there missing streams on maps?
- Is there missing salmon habitat?
- Where are flood-prone areas?
- Where is high landslide risk?
- Where is restoration most effective?

and many others....

Grass Roots

Virtual Watersheds & Tools

Multi-disciplinary Information and Analysis Platform

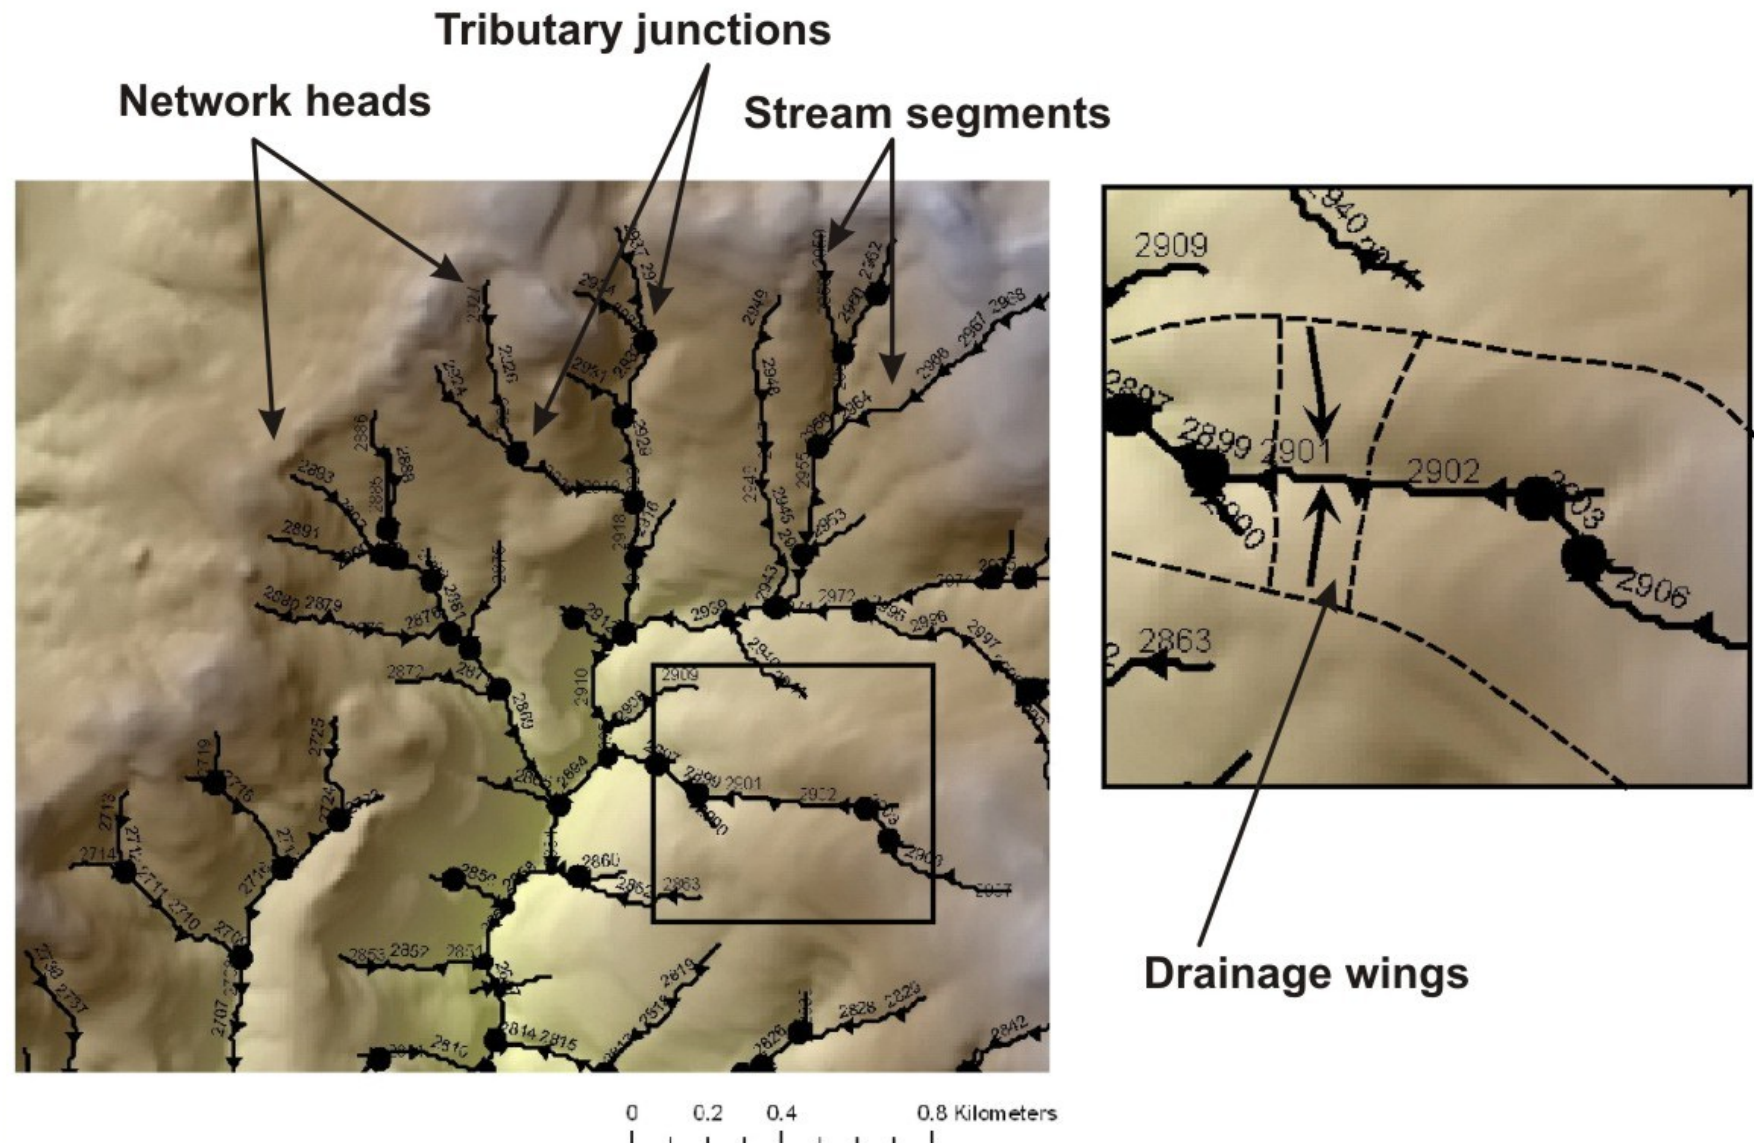

A channel network-watershed data structure that connects lotic, lentic, and terrestrial ecosystems that is designed for applications

Structure of a virtual watershed (NetMap)

(Benda et al. 2007; Benda and Miller 2009; Benda et al. 2011; Miller et al. 2014; Barquin et al. 2015; Benda et al. 2015; Benda et al. submitted)

Virtual Watershed: terrestrial - channel connections

Linking hillslopes
and floodplains
to channels.

Drainage Wings

Each “wing” delineates
the area draining to a
single channel node.

Each node or 100-m stream segment contains numerous channel and upstream watershed information

Channel Attributes

Gradient

Elevation

Distance to outlet

Drainage area

Mean flow

Stream order

Channel width and depth

Bed substrate

Channel sinuosity

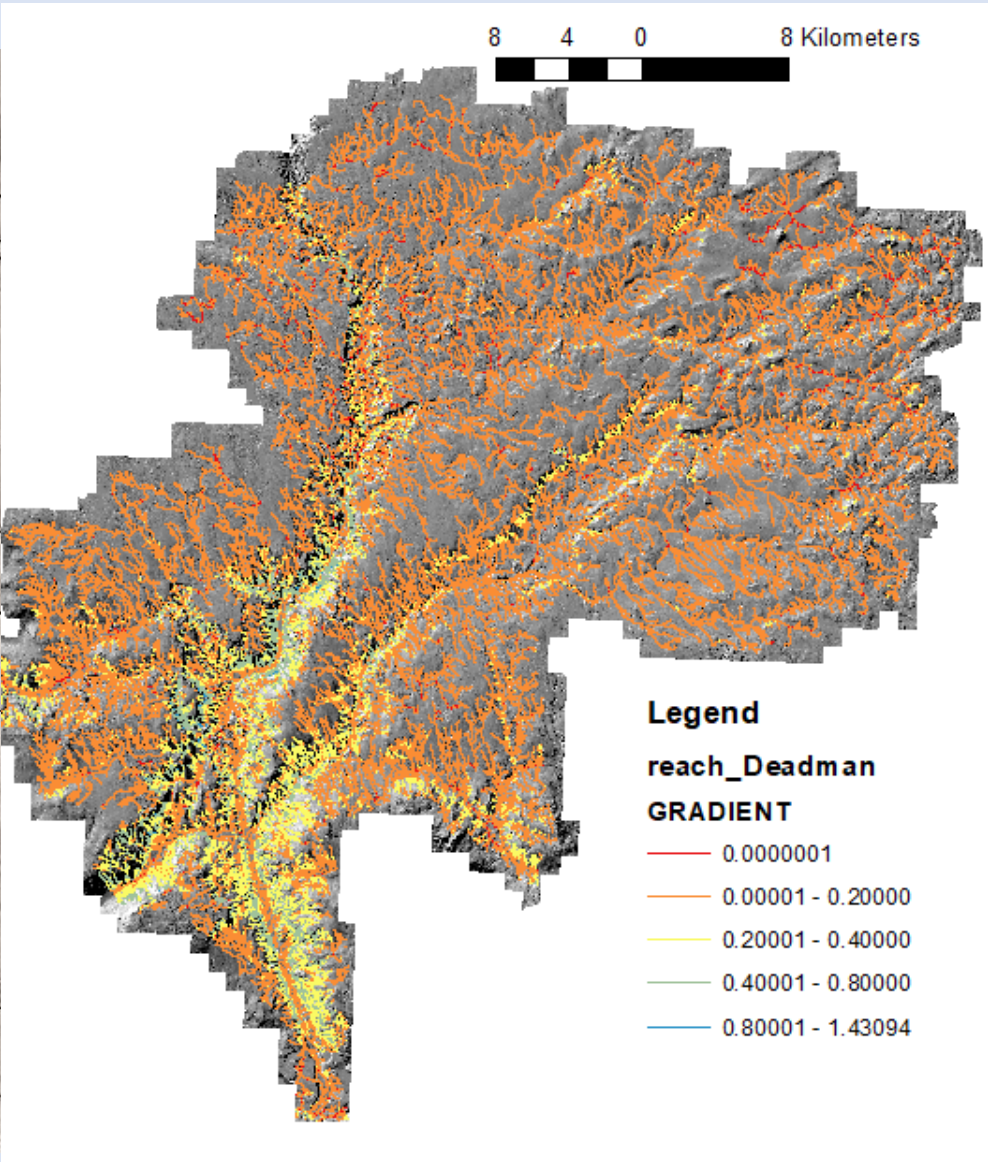

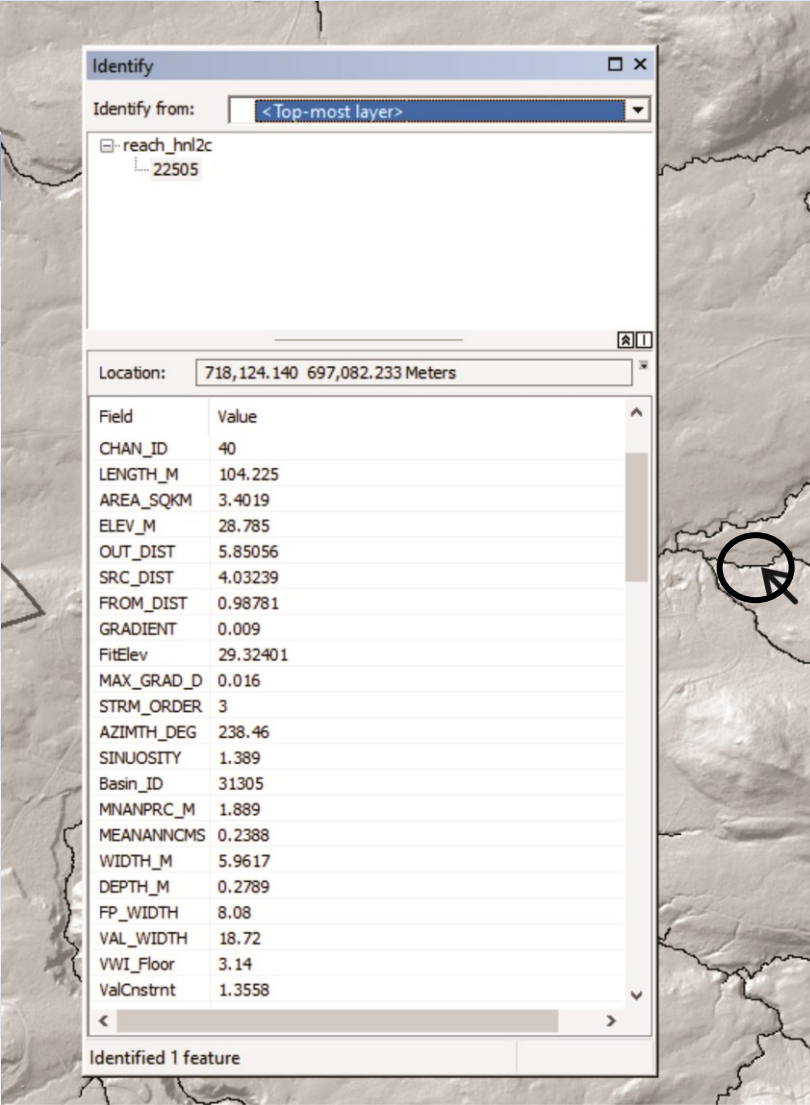

Channel classification

Fish habitats

Radiation loading

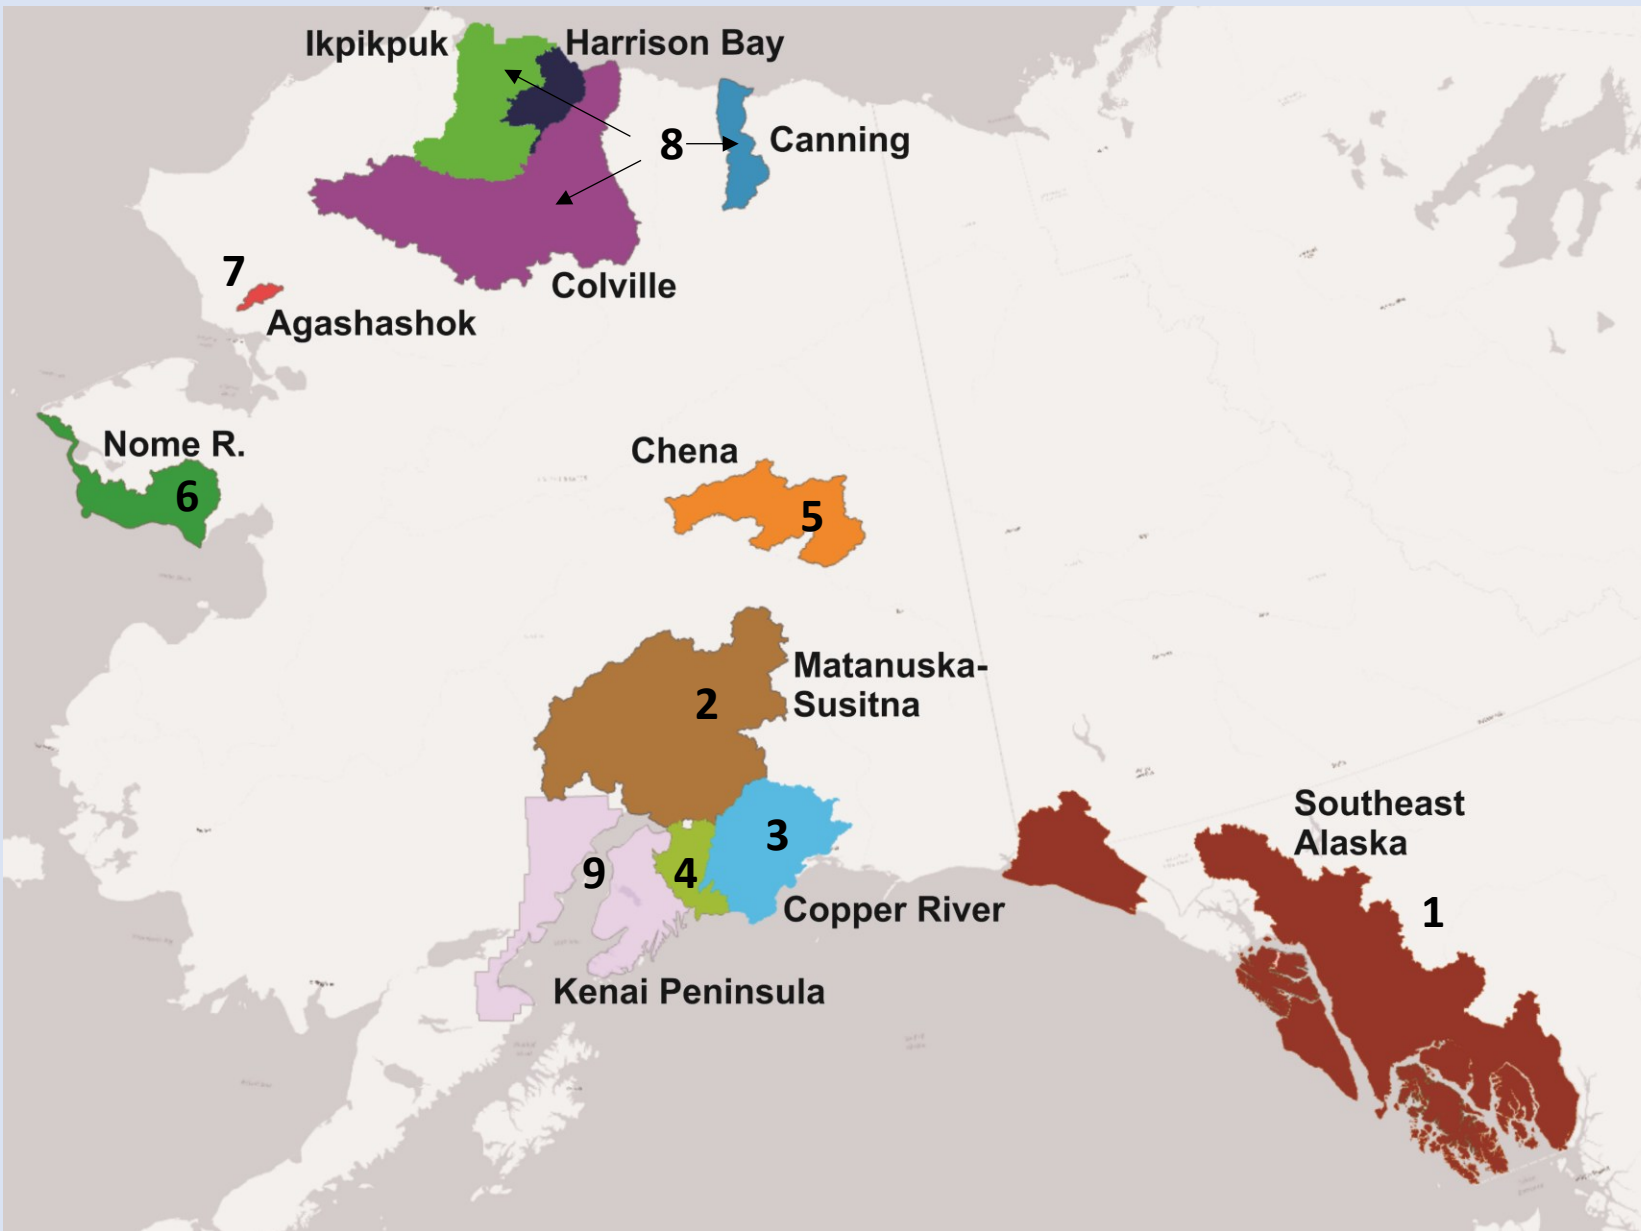

Mean annual precipitation

Gradient

Existing IfSAR and LiDAR based virtual watersheds

- 1) US Forest Service-Tongass/NRCS/Sealaska
- 2) The Nature Conservancy (+ partners)
- 3) Ecotrust/USFS
- 4) Chugach National Forest
- 5) Univ. of Alaska/US Fish & Wildlife
- 6) Arctic-Yukon Sustainable Salmon Initiative
- 7) USGS Fisheries
- 8) The Wilderness Society
- 9) Kenai Watershed Council

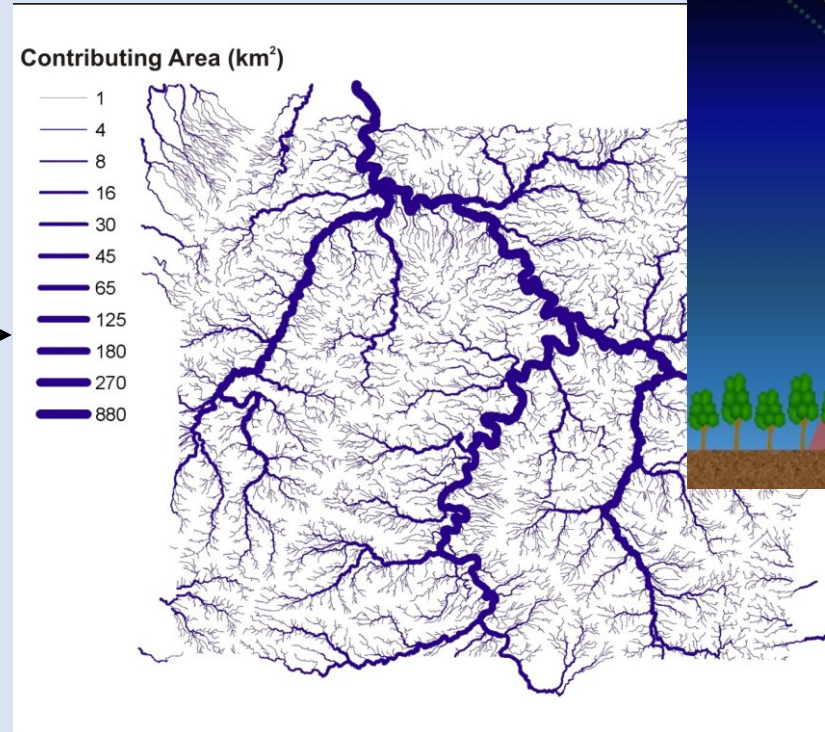

Example Applications

- More comprehensive & accurate networks – Matanuska-Susitna
- Salmon habitat mapping (finding missing habitats)—Chichigof Island, SE AK
- Floodplain and riparian mapping - Prince of Wales Island
- Landslides and debris flows - Sitka, Wrangell, Petersburg
- Forest roads and salmon (fish blockages) - Kupreanof Island

Older “Cartographic”

DEM derived “synthetic”

- More comprehensive & accurate networks – Matanuska-Susitna

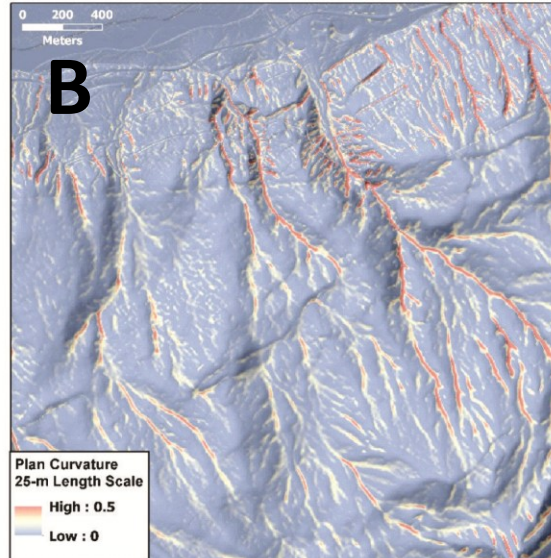

Synthetic channel extraction from
IfSAR or LiDAR DEM

Flow accum: $\text{Area} * \text{Slope}^2$

Fluvial Erosion: Plan Curvature

Candidate Initiation Sites

— Traced Channels

- **More comprehensive & accurate networks – Matanuska-Susitna**

Old Cartographic (NHD) Stream Network

**An additional
25,000 miles of new
stream channels
were identified on
new maps in the
Mat-Su basin.**

New LiDAR Synthetic Network

Chichigof Island, Southeast Alaska

There is a 285% increase in stream length using IfSAR and a 518% increase when using LiDAR.

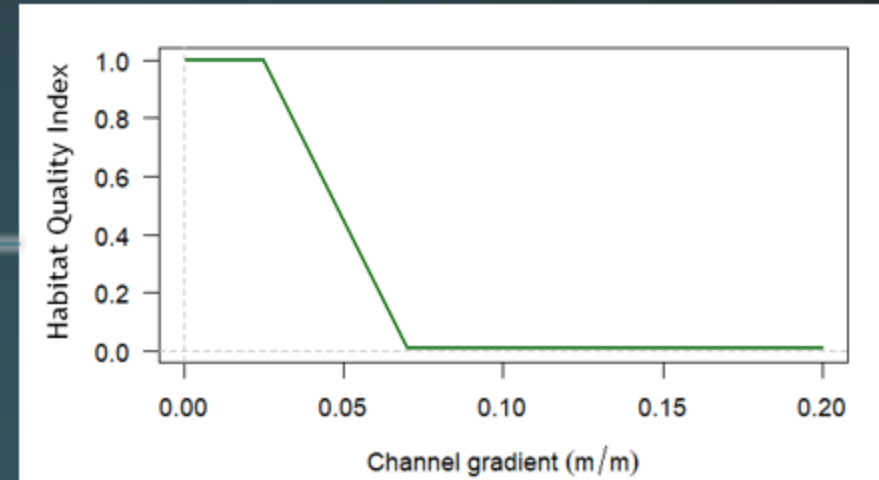

- Salmon habitat mapping (finding missing habitats)—Chichigof Island, SE AK

HIP Modeling Process

1. Develop synthetic LiDAR stream network and habitat attributes (NetMap)
2. Fish density range converted to habitat Index (0-1) for each attribute (Random Forest Partial Dependency)
3. Geometric mean of habitat index for stream reach
4. HIP (habitat quality) then predicted/mapped for entire landscape

Potential to provide
high-quality habitat

Mean Annual Flow

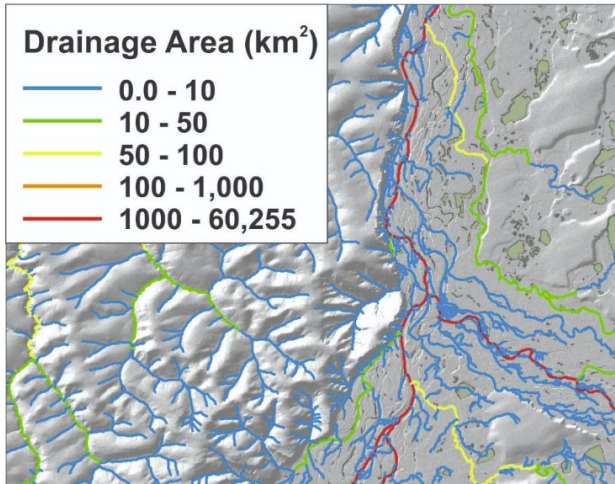

Valley Width Index

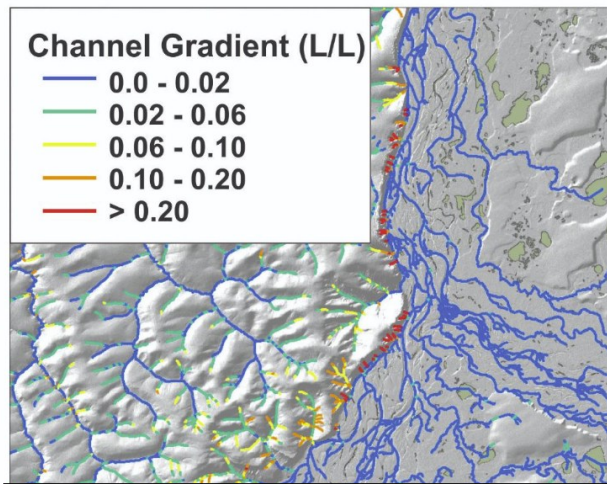

$$\text{Reach HIP} = \sqrt[3]{IP_{grad}IP_{flow}IP_{vwi}}$$

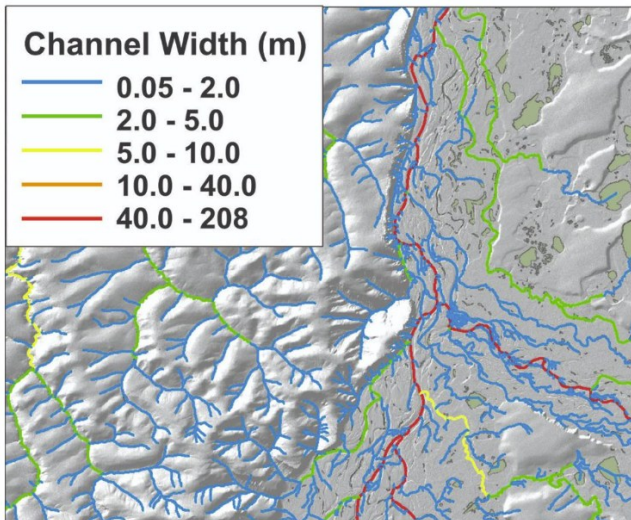

- Salmon habitat mapping (finding missing habitats)—Chichigof Island, SE AK

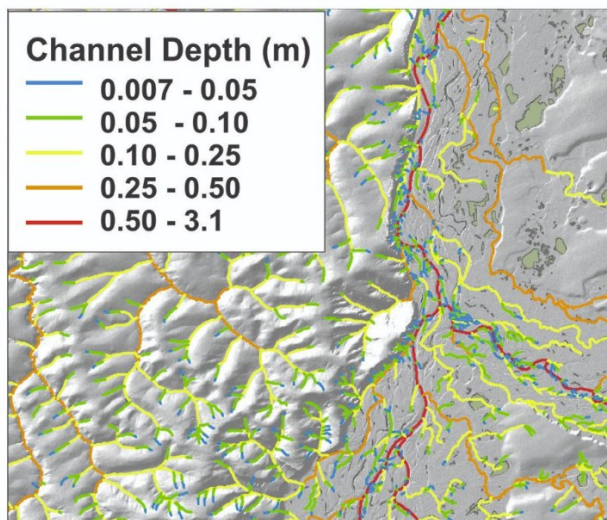

Drainage Area

Channel Gradient

Channel Width

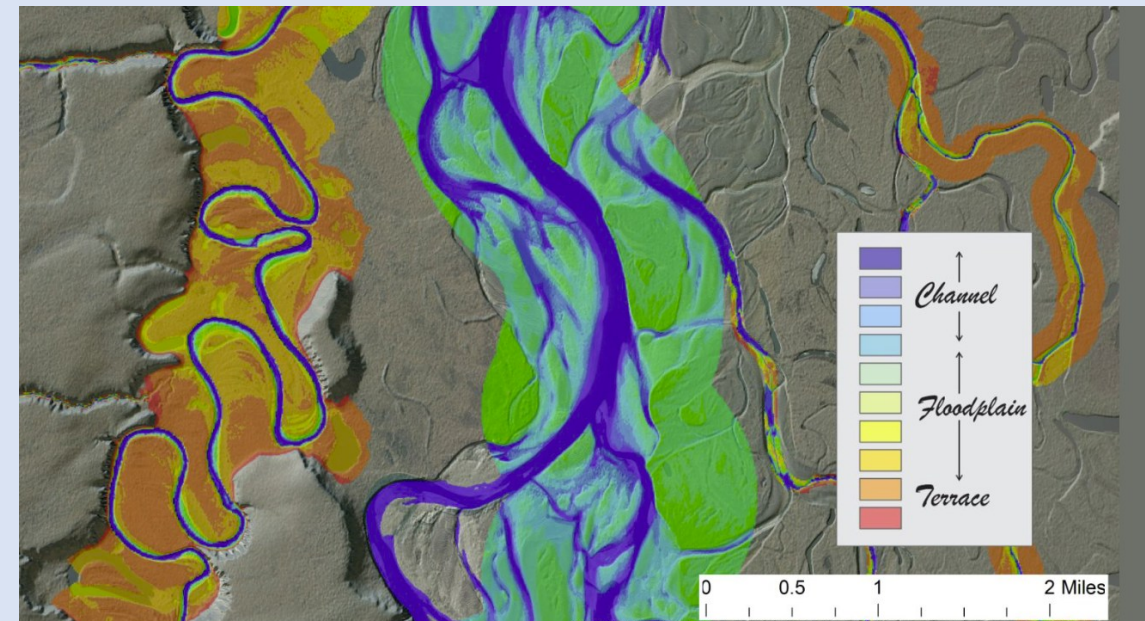

Channel Depth

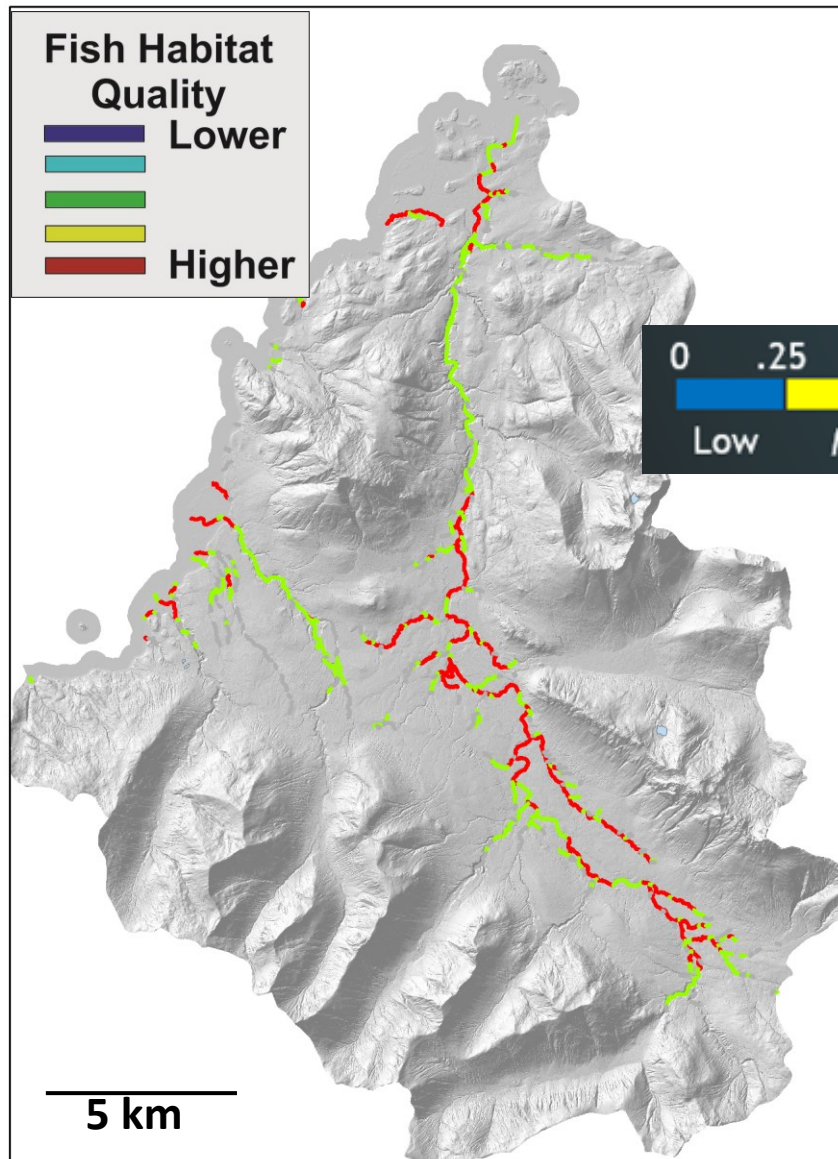

Requires watershed & channel attributes

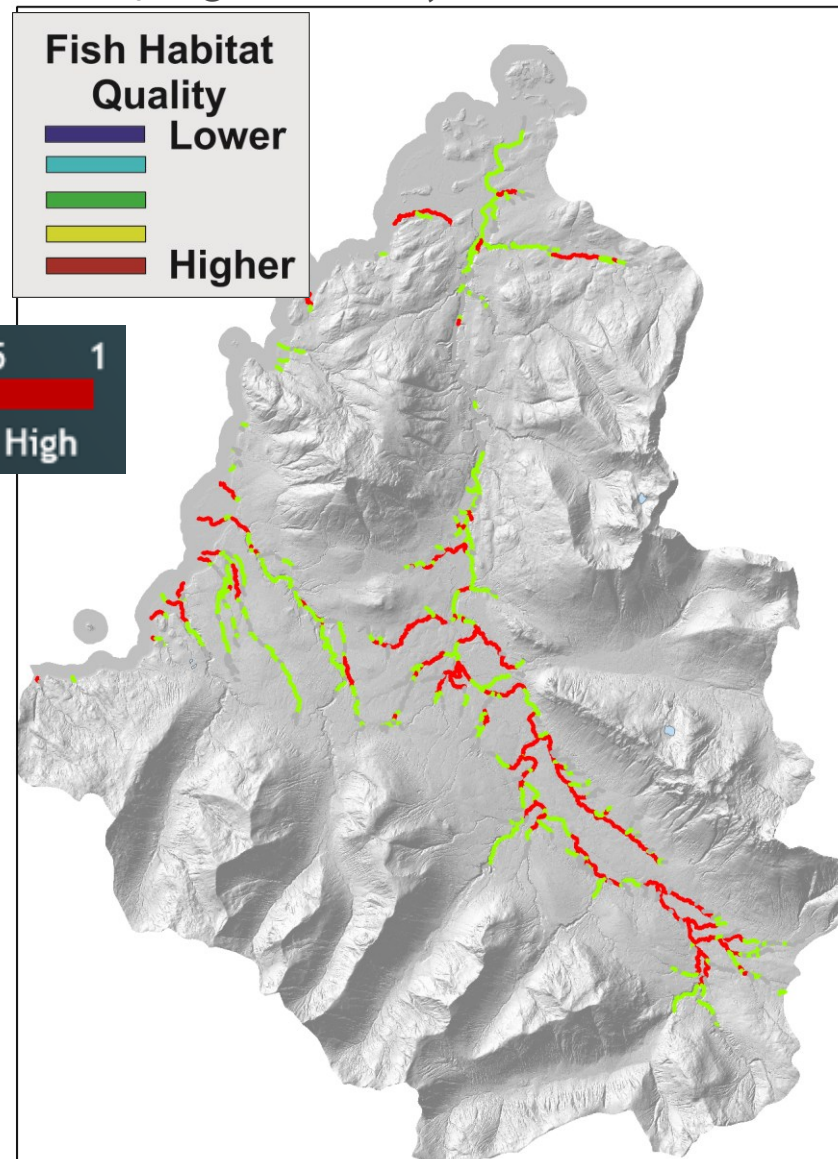

Floodplains/channel confinement

Chum (*Oncorhynchus keta*)

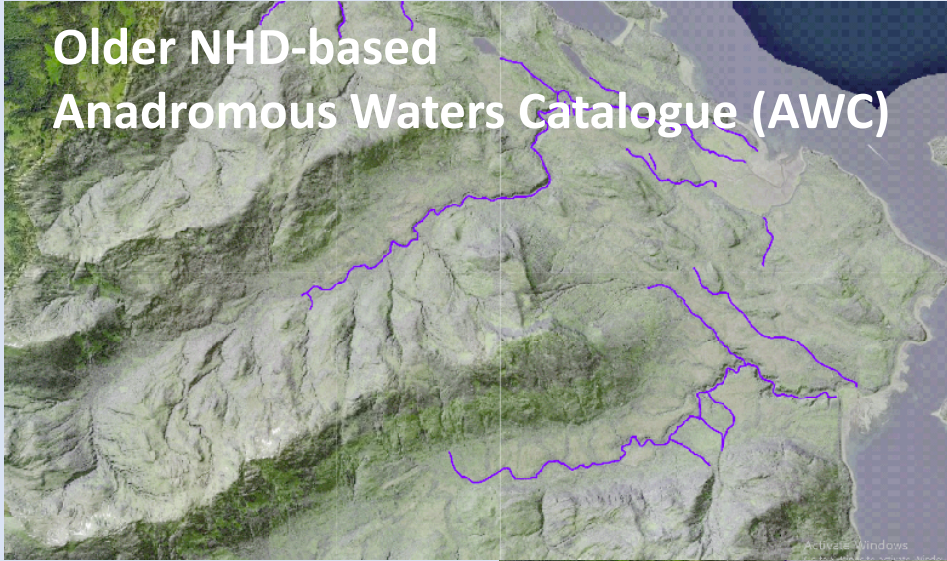

Pink (*O. gorbuscha*)

- Coho salmon habitat mapping—Chichigof Island, SE AK

Older NHD-based
Anadromous Waters Catalogue (AWC)

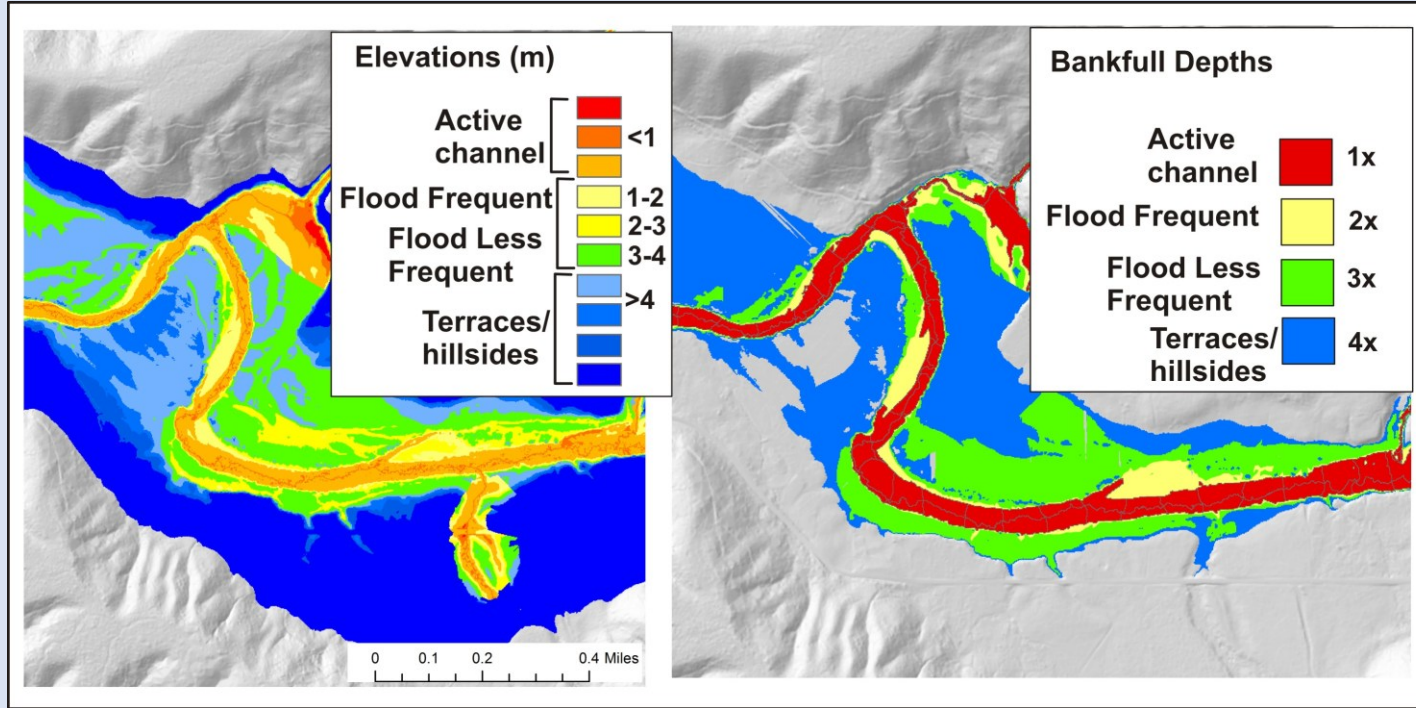

IfSAR synthetic-HIP Model

LiDAR Synthetic

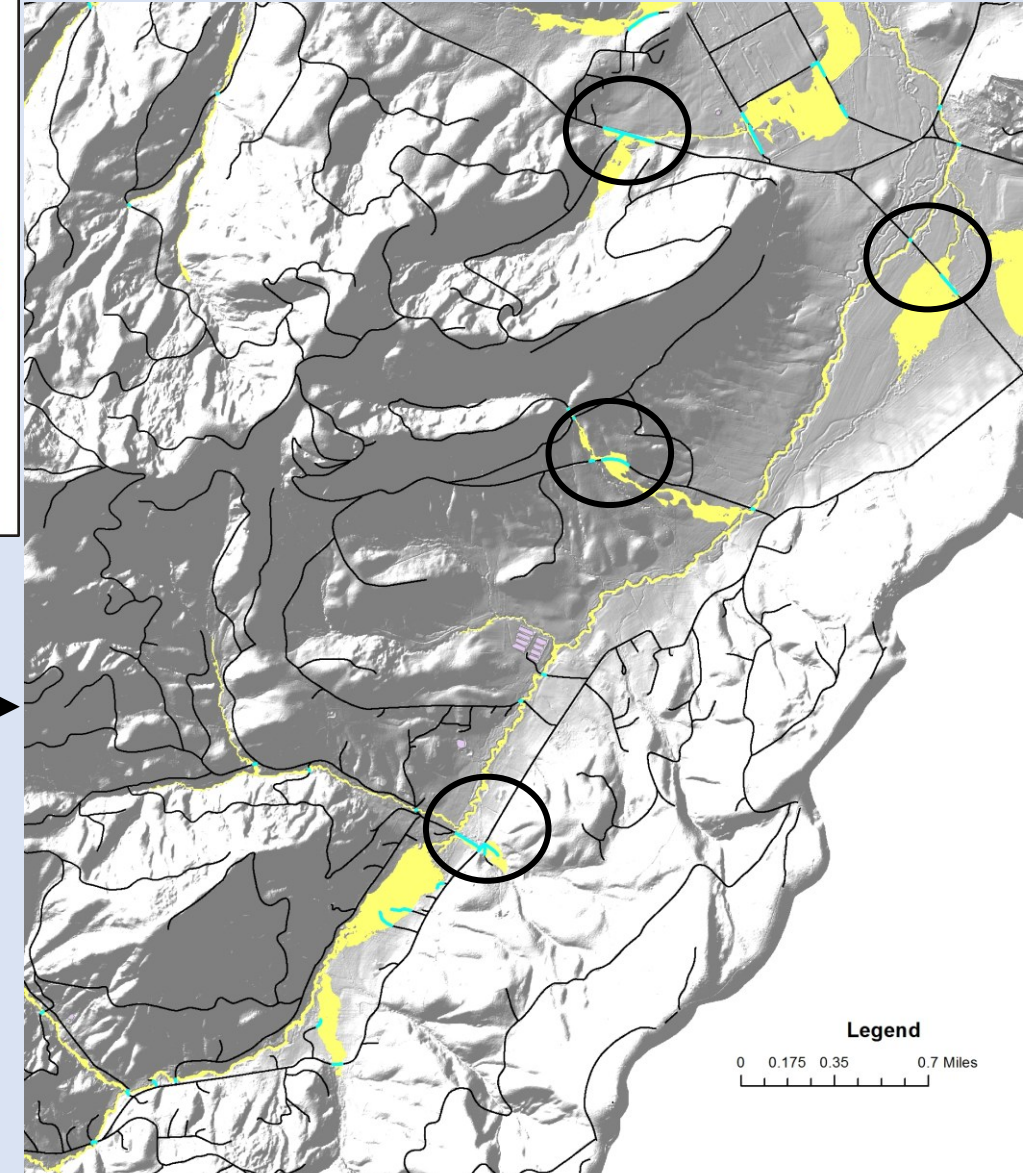

- Floodplain and riparian mapping, Prince of Wales Island

Network of rivers, network of floodplains, network of roads – where are overlaps?

Floodplain

Riparian Zone Protection/Management

Combined

Riparian Zone Delineation

- Landslides & Debris Flow Risk—Southeast Alaska

Haines slide, 2020

Wrangell slide 2024

Anatomy of a Landslide

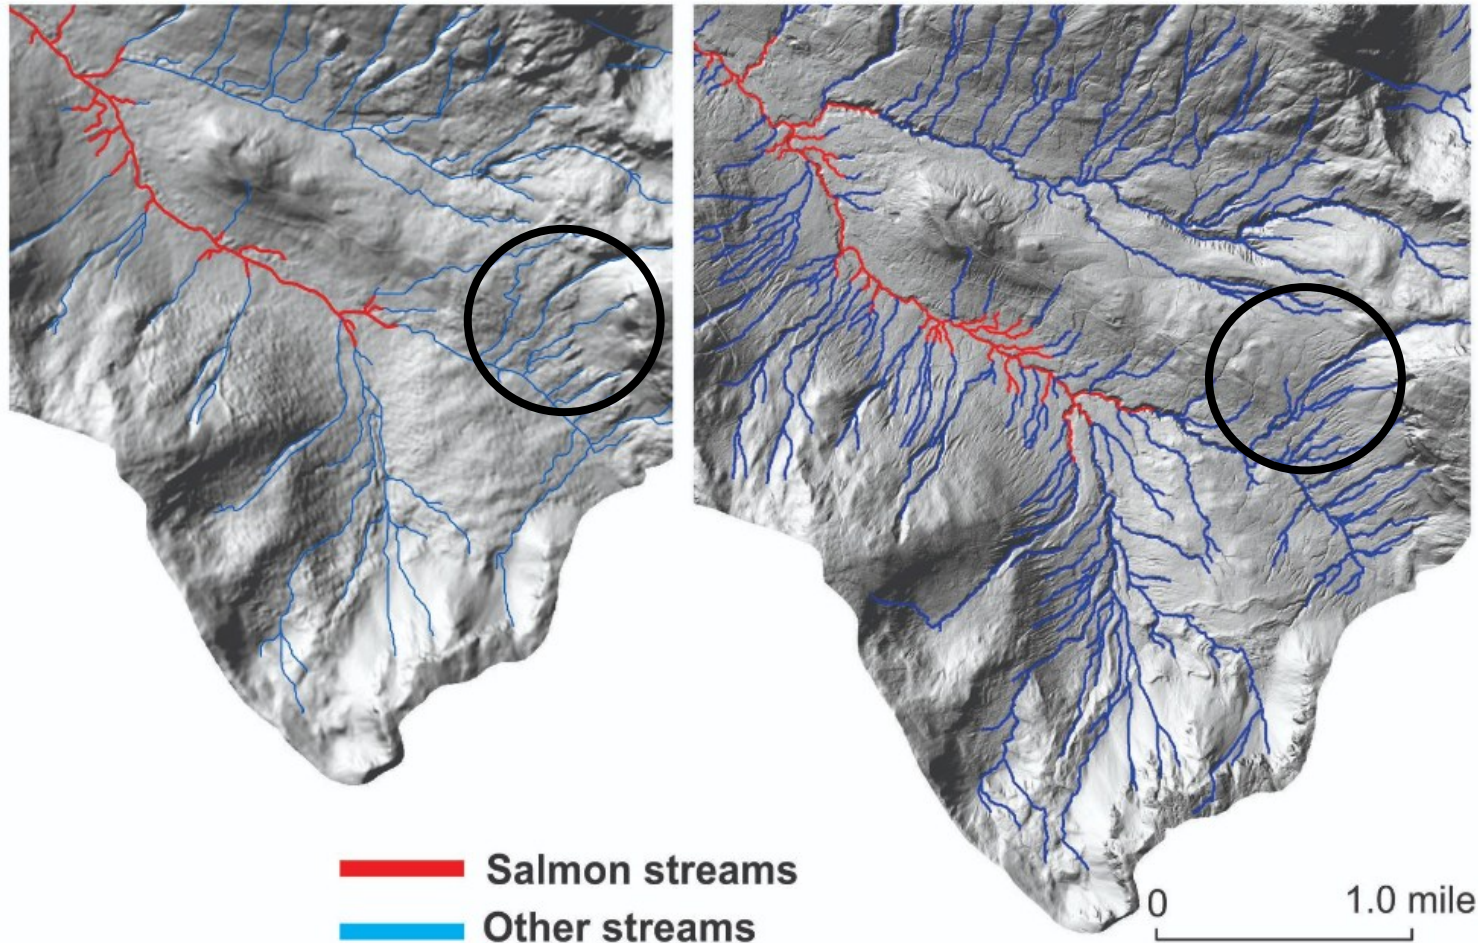

2015 Sitka Landslide

- **Landslides & Debris Flow Risk—Southeast Alaska**

IfSAR 5m

LiDAR 1m

Delineating headwaters and ephemeral streams for predicting runout of debris flows and flash flood potential, and propagating downstream hazards

Empirical modeling, landslide inventory

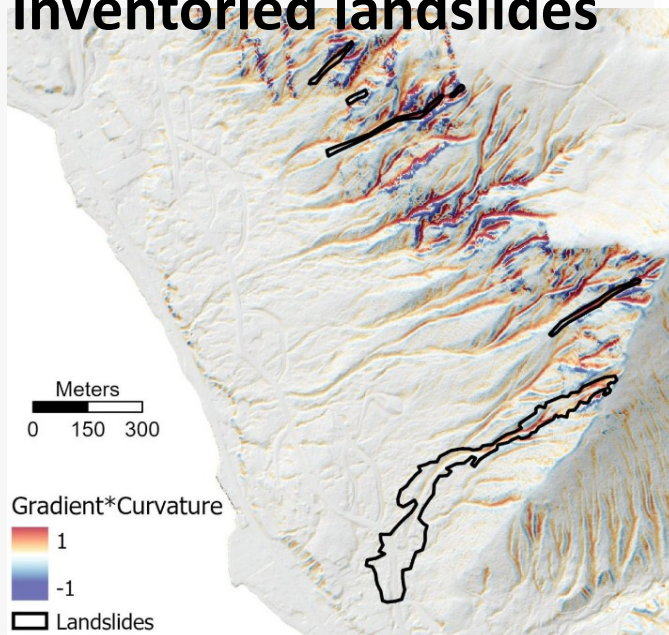

**Mapped Landslides
(Tongass N.F. inventory = 12,000+ slides)**

Predicted Landslide initiation, runout, and inundation (combined)

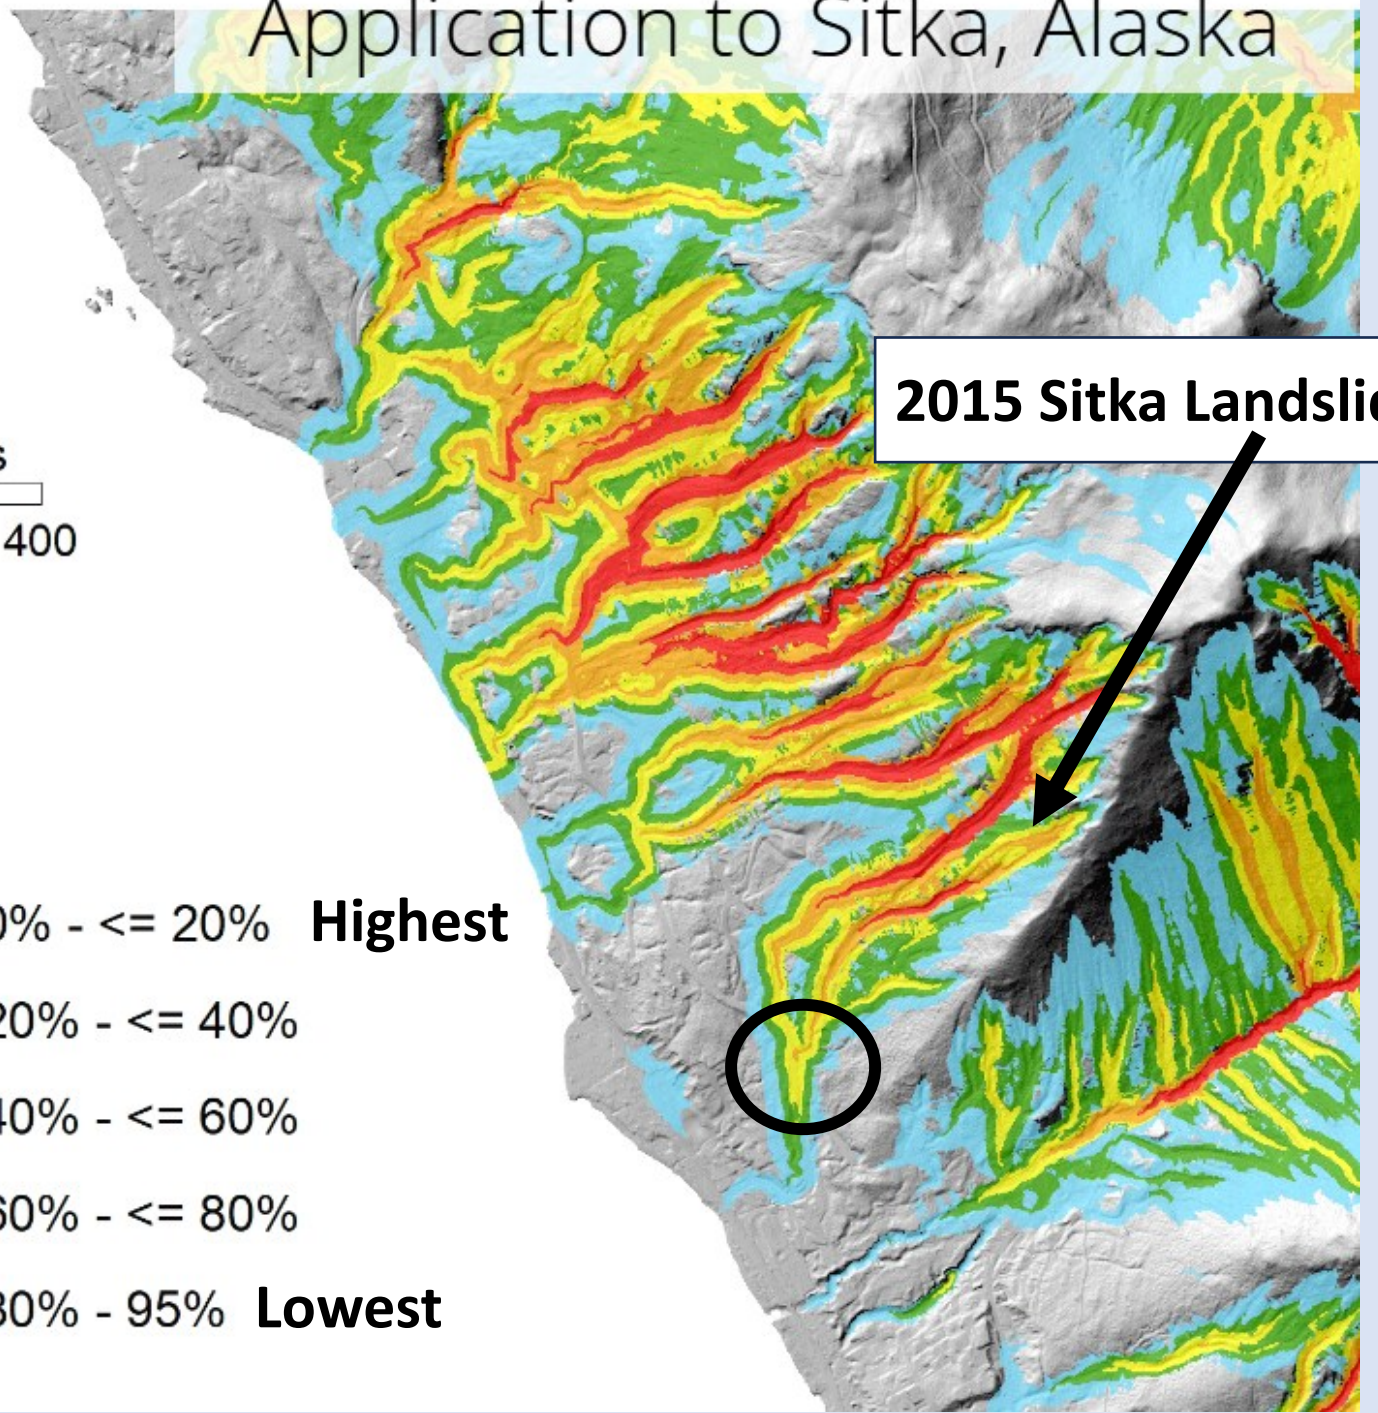

Our model is able to rank increasing levels of landslide susceptibility. The highest 20% is shown in red.

Inventoried landslides

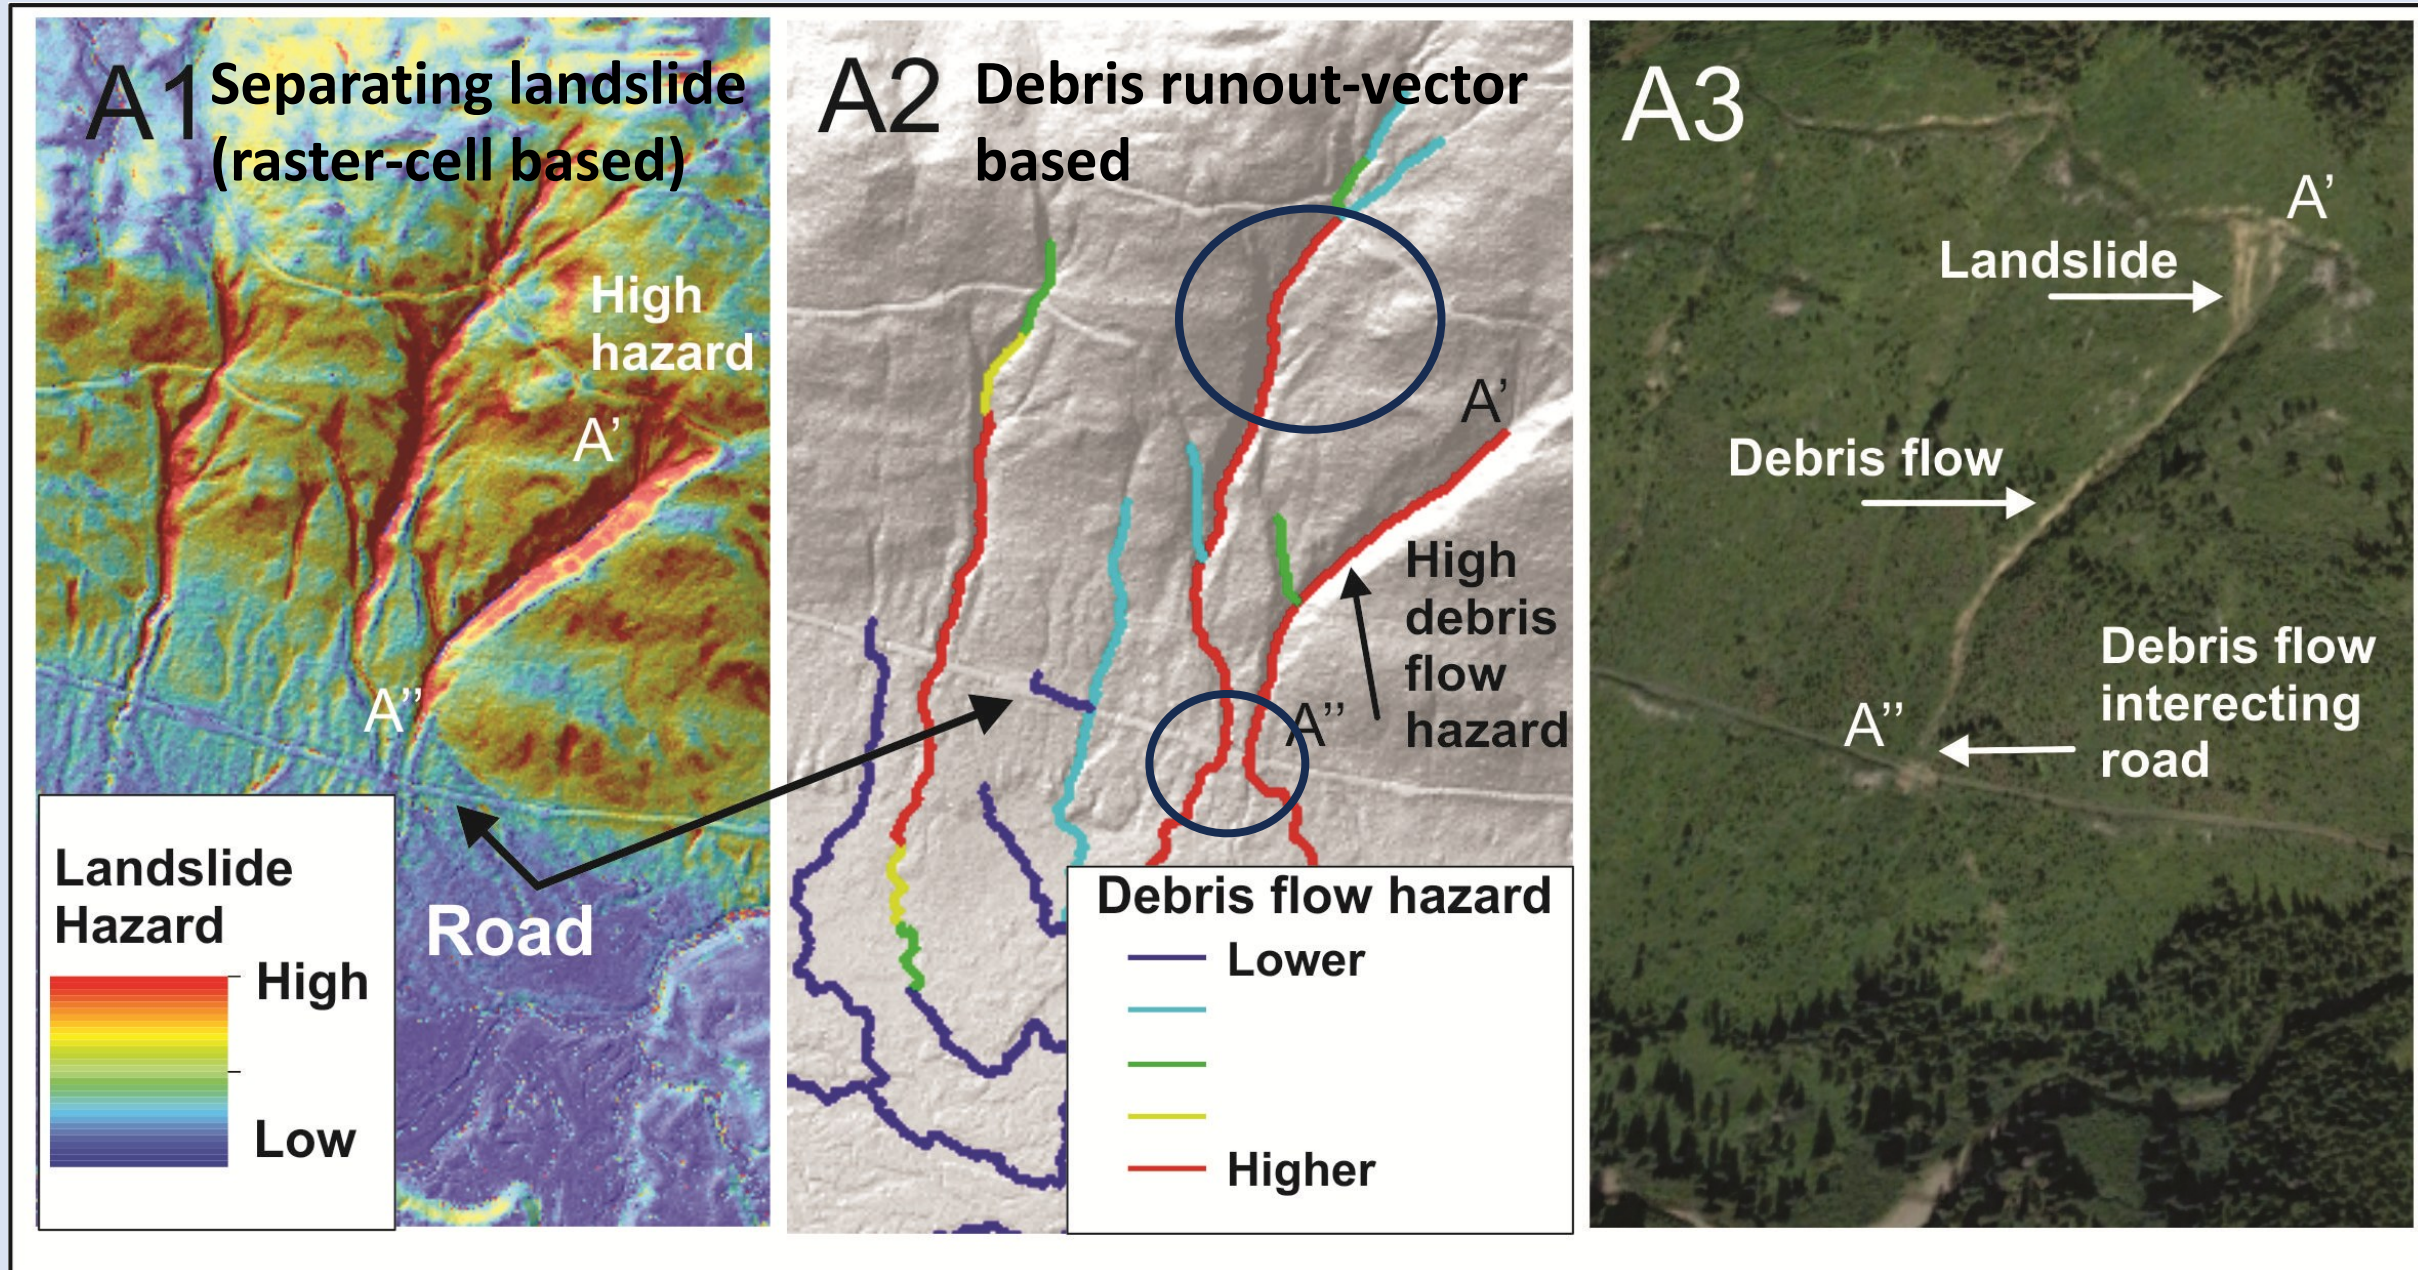

Application to Sitka, Alaska

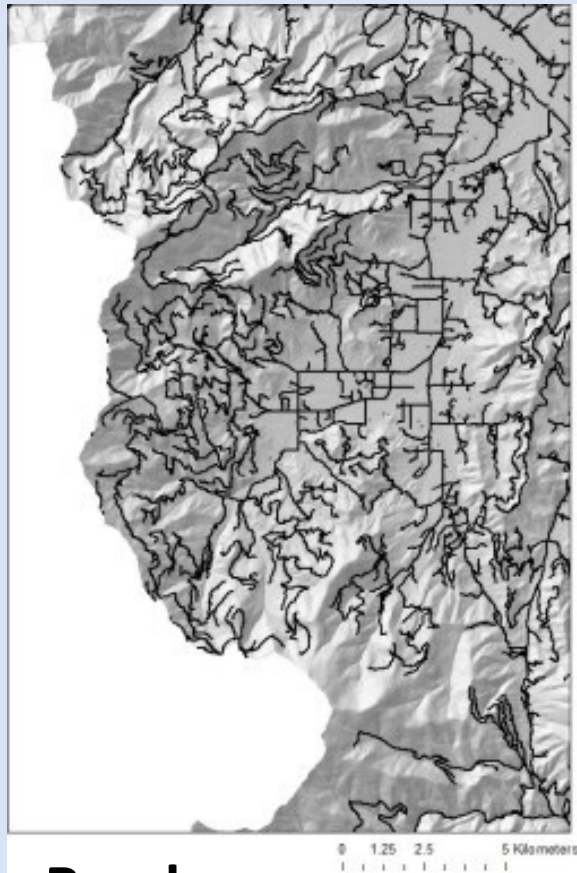

2015 Sitka Landslide

- Landslides and debris flows, Sitka, Wrangell, Petersburg, Prince of Wales Island (fish)

- Forest roads and salmon (potential fish blockages), Kupreanof Island

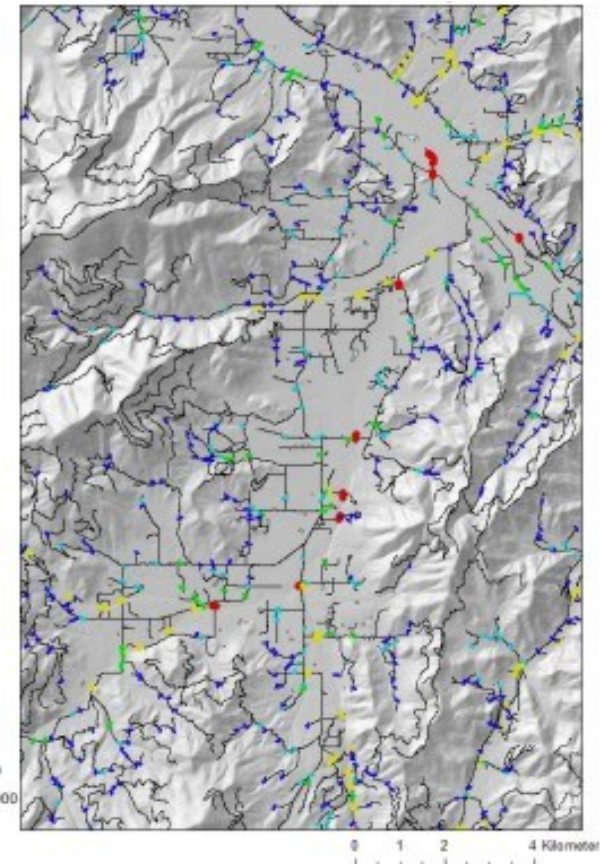

Roads

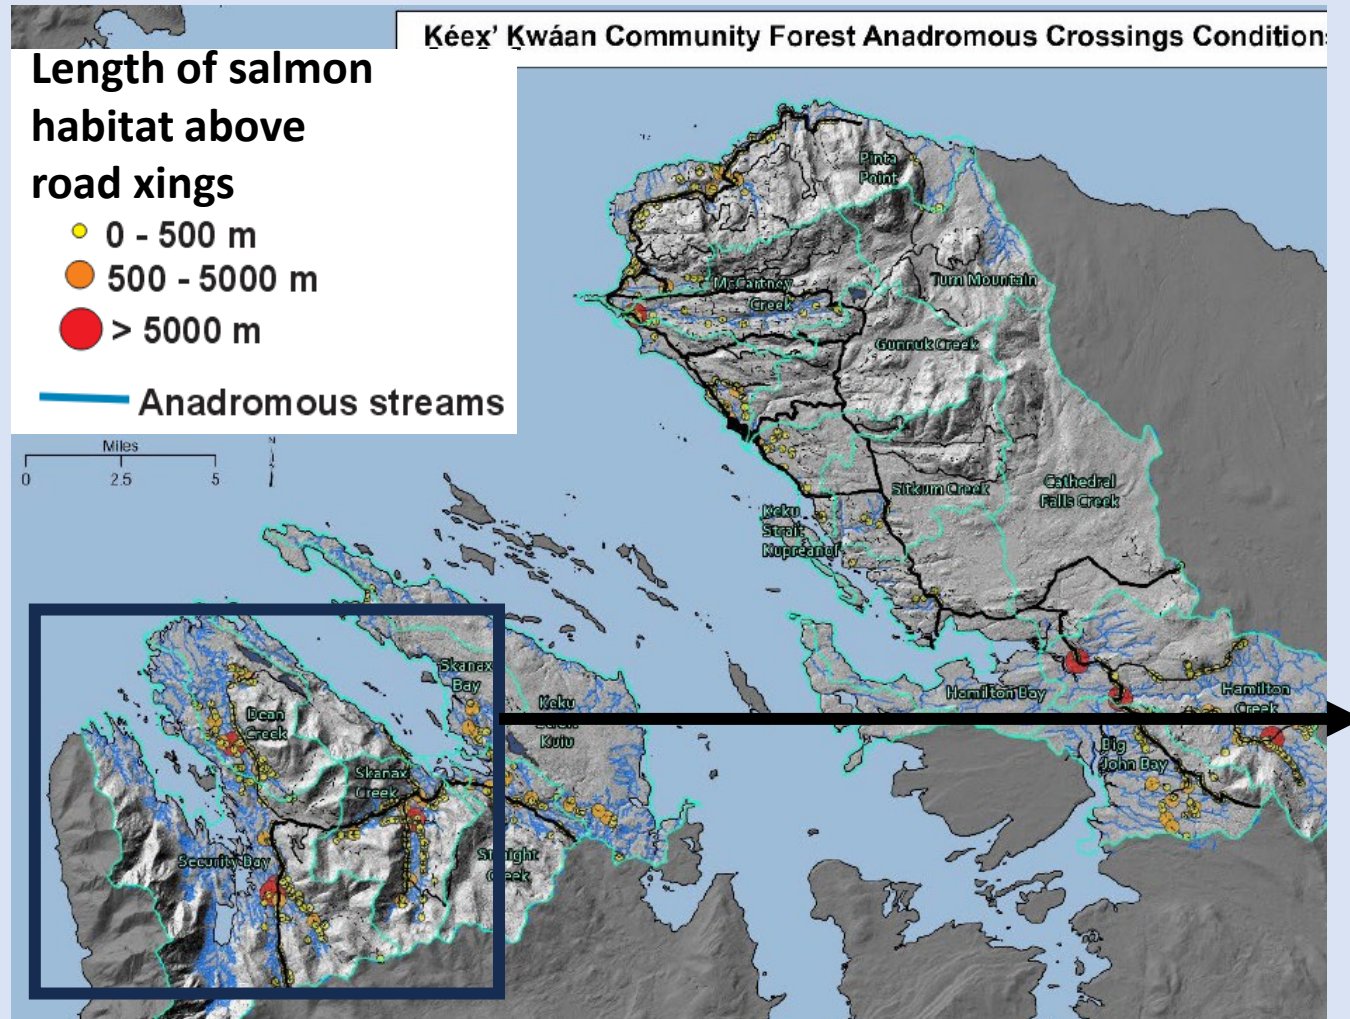

Fish habitat

Habitat length above road crossings

- Forest roads and salmon (fish blockages), Kupreanof Island
