

TERRITORY OF ALASKA

DEPARTMENT OF MINES

*by Goetzky - Anderson
& Glover*Strategic Materials in Alaska

The following list of mineral occurrences was compiled in order to obtain information as to deposits of strategic materials in Alaska. Data were taken from assay records at the Territorial Assay Office at College, from field notes and from prospectors and miners.

Since it was necessary to examine over 35,000 assay and identification records, covering the period between 1917 and Nov. 1, 1941, only those mineral occurrences of possible economic or geologic importance ^{are} were listed here. For example, small amounts of antimony minerals that occur in a very large number of quartz veins are not listed, because they are in general not indicative of occurrences of high-grade stibnite. Unless they are of special interest, gold assays are also omitted because of their great number and because they would add little to present knowledge.

Occurrences of each metal or material are listed separately. For each occurrence the assay number is given to permit reference to the original records; also given are the name and address of the person who submitted the sample, as well as information concerning grade and location of prospect, when this is available.

Since the Territorial law that provides for free assay service stipulates only that those receiving this service be residents of Alaska, there is no way of knowing, from Assay Office records, ^{alone} the exact location of the mineral occurrences listed here.

note In addition, many samples have been submitted through intermediaries such as traders or consultants, so that the name and address of the prospector may not appear. For example, several deans of the School of Mines of the

TERRITORY OF ALASKA

DEPARTMENT OF MINES

Strategic Materials in Alaska (Contd.)

University of Alaska have submitted for assay, under their own names,
samples received from prospectors in all parts of the Territory.

To be of any considerable value, then, the information contained in this list must be supplemented by ~~the~~ first-hand knowledge of prospecting activity in Alaska, as well as by information appearing in U. S. Geological Survey publications. Concerning the last few years, much is known of prospecting activity; for more remote times information becomes increasingly scarce and relatively little is known of the comparatively active period of base metal prospecting during 1917-18.

At present, when the need for all metals is becoming increasingly acute, the need for precise information concerning prospects is apparent. Since Territorial law does not require that this information be supplied, an amendment ^{to the existing law} would be necessary. Required information should include the name and address of the prospector, the approximate location of the prospect and the result of the assay. To protect the prospector this information should be kept confidential for two or more years, during which period it could be used only with the prospector's permission.

Strategic Materials, Base Metals,

and Important Gold and Other Mineral Occurrences in Alaska.

Taken From College Assay Office Records, Starting 1917.

Assay No.	ANTIMONY		
	1917		
MS 142	Fred Wackwitz -- high-grade stibnite	(Fairbanks)	<i>stream of Evidock Creek</i>
	1918		
MS 511	Charles Spann -- stibnite	(Nenana)	
	1919		
MS 835	Martin Strand, Nome -- stibnite		
	1921		
MS 1419	L. Berberian, Mile 315 o/o Alaska Eng. Commission -- stibnite		
	1926		
MS 3544-5	George Woods, Akiak -- stibnite		
	1927		
MS 3619	C. W. Hudson, Livengood -- Au, Ag \$12.50 (920 Au) in stibnite ore		
MS 3832-49	H. A. Vertz, Ohulitna -- stibnite, valentinite, berthierite		
	1928	<i>Sb₂O</i>	<i>FeSb₂S₄</i>
MS 3322	G. F. Dunbar, Fairbanks -- stibnite (67 $\frac{2}{3}$ Sb)		
	1929		
MS 3670	F. T. Richfield, Wrangell -- stibnite		
MS 4974-5	Ed McGann, Crooked Cr., Kuskokwim -- stibnite and cinnabar		
	1931		
MS 4089	Harry Johnson, Moose Pass -- mainly stibnite		
	1937		
T1022-3	Mike Lody, Ferry -- stibnite (Sb 66.8 & 65.0%)		
T1040	Jim Dodson, Glen Airlines -- Sb 29.8% (Wiseman stibnite)		
T1041	Harry Buhro, Fairbanks -- Sb 47.2% (Kuskokwim stibnite)		

TERRITORY OF ALASKA
DEPARTMENT OF MINES

Antimony (Cont'd)

1938

T3904-5 Leonard Newman, Fairbanks -- Sb 67.4 & 60.4%

1939

T6480 Jobe & Schutte, Fairbanks -- 42.8% Sb
 T6481 C. W. Holt, McKinley Park -- 68.6% Sb (also high Pb)
 T7280 Dave Joesting, Fairbanks -- Sb 62.8% (Cosgrove prop., N. limit of Happy Cr.)
 T7303 Egan Petrokov, Valdez -- Sb 15.4%
 T7440 Cliff Shearer, Fairbanks -- Sb 59.4%

1940

T8688-91 Chris Milligen, Eagle Cr. -- Sb 10 to 18% *trib. Treasure Cr.*
 T8709-11 W. E. Greene, Hoaly Forks, -- Sb 31.93%
 T8831 Niel Turner o/o A. Glover -- Sb 56% (picked sample)
 T9294 Paul Glasgow, Chickon -- Sb 31% *Head of Kechumaituk Cr.*

1941

T9835 Gene Erickson, Fairbanks -- Sb 49.26% *At Goodwin prospect, Eagle Cr., trib Treasure Cr.*
 T10974 H. C. Wilcox, College -- high-grade stibnite and gold. *R.L. Vault Cr. cf. Joesting notes*

TERRITORY OF ALASKA
DEPARTMENT OF MINES

Strategic Materials, Base Metals, Etc.

Additional Antimony Occurrences *

The above list of antimony assays is not complete, ^{It} and represents most of the more important assays made at the College assay Office. Special effort was made to include at least one report of the presence of antimony in each region as a record of its occurrence there.

Other known antimony occurrences of particular interest at present follow:

Name	Location	Remarks
Sam Gamblin (cf. Doc Cripe)	3 miles S of Rapids	Old drift driven in 1916-18 in antimony ore.
Lou Gilbert & Howard Sparks	Antimony Cr., Broad Pass, head of Chulitna R.	150' tunnel driven in old days on large but low-grade (30-40%) deposit. <i>S. N. S. Dip 30°</i>
Sam Gamblin	Boulder Cr., trib. to Tok R.	Large stibnite deposit <i>cf. report</i>
Sam Gamblin	Eagle Cr., trib. Copper Cr., McCarthy Precinct	Deposit said to be 4 - 5' thick and high-grade
Al Goodwin	Treasure Cr., Fairbanks district	Stibnite deposit
H. G. Wilcox	Vault Cr.	Au bearing stibnite ore
Al Barlow	Cody Cr., Bonnifield	Sb ore, 47.14% Sb
Don Gustafson	Fairbanks Cr., near Hi Yu Mine	Old Grites & Feldman prospect, stibnite, 60% Sb, about 18" wide.
F. R. Joesting	U. Kansas Cr.	High Sb ₂ S ₃ float, close to lode
Gus Krutsch & Ross Cosgrove	Rt. limit Huppy Cr. 3/4 mi. above road	Large pieces of high-grade float in bulldozed cuts
Ryan Lode	Ester Dome	Stibnite kidneys in shear zone, also at limestone-aplite contact near Bigelow Cabin
Mike Kelly (Sam Godfrey) (Howard Sparks)	No. 16 Above, Livengood Cr. paystreak	Struck stibnite lode while drifting in old days
Otto Geist	Chatham Cr., E - 400' above mouth	<i>High-grade</i> Float brought up by dredge from lode on bedrock
U. S. S. R. & M. Co. McCarty Mine		High-grade stibnite lenses
Mallick & Halverson	Red Devil Mine, 8 mi. below Sleight on Kuskokwim R.	Stibnite lenses assoc. with cinnabar

ASBESTOS

1918

- MS 233 B. B. Shuff, Richardson -- chrysotile asbestos (233 & 236 Mn)
 MS 434 G. A. Frank, Missoula -- serpentine asbestos

1921

- MS 1426 A. E. Burns, Kenana -- long, rather brittle asbestos fibers

1922

- MS 1620 Wm. O'Brien, Ruby -- amphibole asbestos

1923

- MS 1967 Harry Boland, Fairbanks -- serpentine asbestos
 MS 1975 Arthur Crueger, Kenana Ferry -- serpentine asbestos, rather brittle

1924

- MS 2156 Paul Polson, Fairbanks -- amphibole asbestos (brittle and short-fibered);
 -- serpentine containing small amounts of Si in
 pyrrhotite

1925

- MS 2427 G. Foster Jones, Tanana -- amphibole asbestos

1926

- MS 2742-3 O. C. Kerning, Wasilla -- brittle asbestos
 MS 2823 Miss C. C. Reid, Kenana -- poor amphibole asbestos

1927

- MS 3018 Augustus De Koux, Douglas -- amphibole asbestos (poor quality)
 MS 3202 L. P. Dawes, Juneau -- amphibole asbestos (short fibre) (high quality--seems
 to possess good spinning qualities)

1931

- MS 4561 B. D. Stewart, Juneau -- serpentine asbestos (best yet received)
 MS 4575-6 Lawrence Johnson, Big Delta -- amphibole asbestos (short fibre)

NICKEL

Assay No.

1917

- MS 111-119 C. E. Lang, Livengood -- specimen containing chromite & Ni in considerable quantities *see G. E. Lang's Journal, 1917, p. 10.*
- MS 158 E. R. Babcock, Fairbanks -- small amount of Ni

1918

- MS 299-300 C. A. Bryant, Eagle -- trace of Ni
- MS 301-18 C. E. Lang, Livengood -- Ni present in small but probably workable amounts in 12 samples. Minerals gersdorffite, pentlandite, garnierite and chromite *see G. E. Lang's Journal, 1918, p. 10. - Paul Hopkins & Lang.*
- MS 485 E. L. Anderson, Ex 960, Fairbanks -- Tr Ni
- MS 496 L. J. McCarty, Fairbanks -- small amount of Ni
- MS 501 J. J. Barrett, Hot Springs -- nickeliferous pyrrhotite *see G. E. Lang's Journal, 1918, p. 10.*
- MS 558-60 Pat O'Connor, Livengood -- Ni, chromite
- MS 617-18 A. L. Markam, Nome -- Fe, Ni, Cu -- native of meteoric
- MS 650 Chas. Glascock, Chatanika -- Ni in pentlandite

1919

- MS 809 John Lake, Fairbanks -- Ni

1920

- 303 John E. Carlson, Jack R. Roadhouse via Nenana -- Ni 0.08% (Pentlandite MS722-4)

1921

- 526-31 Cook & Murphy, Nenana -- 5.1 Ni, rich Au-Ag *see G. E. Lang's Journal, 1921, p. 10.*
- MS 1400 R. E. Burns, Nenana -- serpentine with small amounts of Cu, Ni, Cr
- MS 1414 E. W. Maher, Skagway -- Ni (garnierite) ; possibility of commercial value
- 034-058 H. Townsend, B. of Mines, Seattle -- Ni Tr to 0.97%

1922

- 1112-14 Ed Smith, Akiak -- small amount of Ni
- MS 1524 Ed Smith, Akiak -- small amount of Ni in pentlandite

1924

- MS 2261-6 H. Townsend, Fairbanks -- Tr to considerable Ni (515 Pioneer Bldg., Seattle)
- MS 2274 F. B. Jiles, Roosevelt -- considerable Ni in garnierite (see assay 2500)

1925

- 2674-77 E. Stiegelmeier, Tanana -- 0.08 to 0.13% Ni
- MS 2394 E. Stiegelmeier, Tanana -- Ni
- MS 2454 N. L. Wimpler, U. S. B. of M., Fairbanks -- specimen containing small amounts of Ni & Cr.

TERRITORY OF ALASKA

NICKEL (Contd.)

Assay No.

1925

MS 2711 F. B. Jiles, Roosevelt -- considerable Ni in garnierite
serpentine containing Ni in millerite or
pentlandite (Cu Mt., McKinley Park)
(Mt. Eielson)

1927

3924 Louis Brigel, Fairbanks -- 0.2% Ni
MS 3028 L. E. Banzer, Valdez -- Cu & Ni in pyrrhotite
MS 3108 Eli Larson, Valdez -- by Patty -- Ni & Co

1928

4659 Fred Johansen, Valdez (E. H. Patty) Ni & Pt; Tr Cr₂O₃; Tr Ni & Pt
MS 3392 Fred Johansen, Valdez -- chromite, Tr Ni & Pt

1929

5167 Mrs. C. W. Hudson, Livenood -- Ni 0.31 (green stain said to be nickel
mineral is altered serpentine)
5406 W. J. Shannon, Honolulu Sta. -- contact metamorphosed limestone containing
very small amount of Ni Cu Mt.
MS 3664 Mrs. C. W. Hudson, Livenood -- Ni 0.31%
MS 3740 W. J. Shannon, Honolulu Sta. -- Ni
MS 3757 H. L. Winkler -- (see MS 301-13)

1930

6020 H. J. Leonard, Ex423, Juneau -- Ni - 0.38%
MS 4122 " " " "

1931

MS4394-5 F. E. Turner, Wrangell -- Ni, Mo
01496 B. D. Stewart, Juneau -- 1.14%

1932

MS 4805 B. D. Stewart, Juneau -- graphite in large flakes; Ni

1934

9711-18 Evanson, Alex, Fairbanks -- 8 samples containing garnierite, 1 in large amount
9929-34 Alex Evanson, Fairbanks -- Ni 0.15 to 0.65% *Green staining, upper part of Mt. Eielson Co.*
MS 5607 Alex Evanson, Fairbanks -- (same as 9711-18) *Green staining, upper part of Mt. Eielson Co.*

PETROLEUM - COAL

Assay No.

1920

MS 1054 Edmond Moore (a/o J. H. Miles), Nenana -- petroleum
M 51059 R. R. Robinson, North Nenana -- petroleum (asphaltic?)

1921

MS 1242-4 C. A. Frank -- anthracite (Broad Pass via Nenana)
MS 1301 Vance McDonald, Fairbanks -- cannel coal or rich oil shale
-- specimen containing Na, KCO_3 , NaCl, C, $MgCO_3$
MS 1304 R. R. Robinson, North Nenana -- oil sand containing crude S

1923

MS 1826 Chief Jonas, Ft. Yukon -- oil shale and a high-ash, anthracite coal
MS 1860 Lee Pate, Ft. Yukon -- bony anthracite or carbonaceous shale

1924

MS 2182 Bartley Howard, Anchorage -- oil sample

1926

MS 2863 M. J. Conroy, Anchorage -- paraffine (ozocerite) ? artificial
MS 2937-41 Frank Holzholmer, Juneau -- oil shale to bony coal

1928

MS 3273-4-5 P. R. McGuire, Box 1448, Ketchikan -- oil shale

1930

MS 3912 M. L. Sharp, Anchorage -- St. Lawrence Island lignite (pitchy) (O. Geist)

1931

MS 4508 Harry Anthony, Ft. Yukon -- high grade bituminous coal (see file 733 for analysis)

1932

MS 4678 Stephen Ribstein, Eagle -- oil shale, 3 gals./ $\frac{1}{2}$
MS 4650 " " " " " " , low grade
MS 4794 Wm. Meldrum, Fairbanks -- asphalt or petroleum pitch (gilsonite?) 40 Mi. area

1933

MS 5192 Stephen Ribstein, Eagle -- bituminous coal

DEPARTMENT OF MINES

Strategic Materials, Base Metals, etc.

1918

Assay No.

1918

- MS 806-19 Chas. Spohn, Nenana -- Epsom salts, aka. $MgSO_4$
MS 529-32 Valentine Lesoure, Nenana -- fluorite

1919

- 92 Joe Taylor, Nenana -- high pb, ag ore
MS 669 Ma. McCarty, Mile 43, Nenana -- barite and witherite

1920

- MS 221-5 Mr. Grant, Kantishna -- Au, Ag, Pb, Zn, Cu ores (also G. M. Grant)

1921

- MS 549-52 J. C. Price, McGrath (Ruby) -- high Ag, Pb assays
MS 1266 M. Moon, Unalakleet -- stibnite, chalcopyrite
MS 1282 A. Muller, Kaltag -- lapis lazuli
MS 1299 G. A. Frank, Fairbanks -- tripoli
MS 1185 James Ward, Ft. Yukon -- brine from salt lake, Na & K Cl , $NaSO_4$, $CaCO_3$

1922

- MS 781-2 E. Roland & Alfred Hendrickson, Ruby -- rich Au, Ag, Pb ore
1254 Charles Rose, Unalaska -- Au 0.12 oz., Ag 0.50 oz., Cu 0.86%, Zn 30.88%

1923

- MS 1293 Rowley Sterling, Fairbanks -- rich Au, Ag, Pb, and Zn ore
MS 1949 Logan Stipp, Nenana -- gibbsite

1924

- MS 2095 J. P. Jiles, Lake Minchumina -- Au 0.08 oz., Ag 207.5 oz., Pb 61.5%, Cu 1.8%
MS 2038 I. H. Forstad, Doyhof -- native Ag
MS 2144 G. L. Frank, c/o I. C. Nagley, Pitkeetna -- wollastonite
MS 2227 G. A. Frank, Chaditna -- pyrrhotite and Cu *present address (1941) Missoula, Mont.*

1925

- MS 2272 G. L. Tolstovskii, Unalaska -- specular hematite -- also Pb, Cu, Zn
MS 2280 A. G. Legendet c/o E. Phillips, Fairbanks -- fluorite coated with Zn oxides
MS 2100 A. Muller, Kaltag -- obsidian
MS 2453 E. L. Wheeler, Fairbanks -- epsomite with melanterite and alunogen
MS 2595 John Wittich, Bettles -- clay similar to bentonite

TERMINOLOGY OF ALASKA

Strategic Materials, Base Metals, Etc.

MISCELLANEOUS (Contd.)

Assay No.	1926
MS 2636	Joe Sherwood, Medfra -- native Bi
MS 2764	Neill McCall, Healy -- Bi
	1927
MS 2142-7	Noel MacGregor, Petersburg -- obsidian
	1928
MS 2218	E. McLeod, Iliamna -- obsidian <i>Sample from company in Alaska</i>
MS 2254	J. L. Jean, Good News Bay -- high Ag galena
MS 2270	Ir. Smith, Kotzebue -- stony meteorite (?) 1/2 of Pt
MS 2375	Joe Konechnoy, Eskimote -- Au, Ag 37, Cu 4.1%
MS 2519	Harry Russell, Port Hobson, Kodiak -- SnS, FeAsS
	1929
5359	A. B. Stephenson, Iliamna -- 36.50 in Au, Ag and considerable Zn, Pb & Cu
5422	F. E. Co., Fairbanks -- 40.5% Fe, 0.05% Sn
5494	J. W. Southward, Kotzebue -- high Pb-Ag ore
5522	A. G. Singleton, Valdez -- 11% Sn
5603	E. F. Patty, Fairbanks -- 17% Sn (sample named Unalaska)
MS 2696	W. H. Ireland, Monkshee Springs -- Au, Ag, Cu, Pb
	1930
5607	Peter Jorgenson, Petersburg -- high Pb, Zn ores (15% of each) and Au, Ag
5612	Pawkins & Hansen, Dome Cr. -- rich Au, Ag specimens containing Cu minerals
5630	Leo H. Rodrigue, Medfra -- Au, Ag 171, Cu 19.7%
5676	Bill Hammorsloy, Iliamna -- high Ag galena ore
5693-4	J. O. Warren, Fairbanks -- Au, Ag 23, Pb 22%, Zn 13%
5736	F. E. Co., Fairbanks -- Au, Ag, 11% Cu, 24% Zn
5766	I. W. Turkeypille, Poorman -- low Au, Ag, Pb 6%: from Selawik (other Pb assays from there)
5927	W. B. Rodman, Ft. Yukon -- galena, low in Ag
6039	Reinken Bros., Unalaska c/o W. H. Taylor, Cordova -- Cu, Pb ore
6047	Frank G. Manley, Fairbanks -- Cu 12%
6158-60	G. G. Shannon, Honolulu Sta. -- 17% Cu, high Ag; rich tetrahedrite
6176	Alex Karalan, Kiana -- Cu 7 to 8% in various samples submitted
6177	J. E. Strand, Medfra -- Au, Ag 115, Cu 48%
6182	Andrew Draglich, Healy Fork -- Pb, Zn ore
6269	H. Stroussberger, Fairbanks -- Au, Ag 30, Pb 27%, Zn 7%
MS 4106	John K. Dryer, Dewara -- obsidian
MS 4203	Rlt. Heath, Fairbanks -- obsidian
01160-2	W. D. Stewart, Juneau -- Fe 20 to 25%

 UNITED STATES GEOLOGICAL SURVEY
 BUREAU OF MINES

Strategic Materials, Base Metals, Etc.

MISCELLANEOUS (Contd.)

Assay No.	1951
6801	Durrell Finch, Chulitna -- Cu 7%
MS 4320	E. J. Howe, Nome -- obsidian
MS 4250	Fred A. Henton, Kodiak -- fossil resin
MS 4623	Lon French, Plat -- realgar
	1952
7193-4	Hawley Sterling, Lakona -- Au, Ag 20/2, Cu 25 and 40%
7248	Bill Hammersley, Illinois -- Cu 11%
7256	James A. Stewart, Miller House -- specular hematite, 54.47% Fe; 0.001 Phosphorus
7754	Chas. Derison, Illinois -- small amount of Ni
	1953
MS 4994	Earl L. Dyer, Petersburg -- dike dior
MS 5025	Sam Kope, Lottles (S.A. Geist) -- chlorite gabbro containing free Au (est. \$1000/T)
MS 5056	Thos. Perryman, Hotzebus -- Jade of nephrite variety, orange end of poor color
MS 5102	B. D. Stewart, Juneau -- novaculite
MS 5103	Ralph Reed, Seward -- punch mice
MS 5234	C. Clausen, Okechikuk, -- quartz crystals
	1954
9197	A. Crane, Fairbanks -- galena from Brenner region, Au, Ag 120, mostly silver, Pb 81%
MS 5434	Melvin H. Gase, Chitina -- Au, Ag 1100; arsenopyrite containing Ni & Co
MS 5801	Brown Carlson, Illinois -- obsidian
	1955
10709	A. L. Gillis, Cordale -- galena rich in Ag
10741	W. K. Paasankari, Igrook -- Pb, Zn
10904	Fred P. Johnston, Inalaska -- Au, Ag 24.76; Cu 4.4%; Pb 11.7%; Zn 34.0%
16052	R. H. Krantler, Old Harbor -- pyrrhotite. Cu, Ni
688	A. H. McCard, Fairbanks -- quartz vein 6' wide, head of Starvation Cr on Porcupine Dome; great samples from various points along 400' of vein average \$10.36
G276-8	Brenner, Birdwood (Greenback Mining Co.) -- consistently high Au, Ag values
	1956
16233	Fred P. Darocher, Council -- iron meteorite and Ni, C
6810	John Olsen, Humphrey's Pt. via Barrow -- vein 20' x 700' 20.25 in Ag, Gordon Cr. trib. to Skpeluk R.

DEPARTMENT OF MINES

REPORT ON MINING ON THE SEWARD PENINSULA DURING 1942 AND ON THE POSSI-
BILITIES OF MINING STRATEGIC MINERALS

By H. R. Jorating

Introduction

The period Nov. 15-19, 1942, was spent in Nome for the purpose of obtaining information on (1) mining operations on the Seward Peninsula during 1942, (2) the probable extent of 1943 operations, (3) the possibilities of producing strategic minerals and the manner in which the Department of Mines could aid production, (4) the physical condition of the Nome Assay Office and (5) the desirability of offering a mining short course, given by an engineer of the Department of Mines stationed at Nome, under the jurisdiction of the University of Alaska.

Mining Operations during 1942

Lists of lode and placer mining operations during 1942 in the various precincts of the Seward Peninsula were prepared and have been submitted in advance of this general discussion. At the time the lists were prepared most of the mining operations had shut down for the season, consequently it was necessary to obtain information from those operators and other individuals who happened to be in Nome at the time. Although every effort was made to check this information, it is likely that the lists contain a few inaccuracies, since at many operations there were frequent changes during the season in the number of men employed.

As in other parts of Alaska, placer mining was seriously curtailed during 1942, chiefly because of a shortage of labor. Practically all of the active mines worked with smaller than normal crews, and many of them shut down altogether. Other reasons for curtailment were increased costs of labor and equipment, and difficulties in obtaining fuel, equipment and supplies. These increased

MINING ON SEWARD PENNINSULA

operating costs and shortages of material are, of course, the result of war-time conditions in general and the program of military construction on the Seward Peninsula in particular.

No gold lode mines were active in 1942. In previous years several lodes were in the process of intermittent, small-scale development. Considerably less placer tin was mined than in previous years; the only production was a small amount sniped by Eskimos in the York district. Most of the concentrates thus produced, amounting to 1,000 pounds, were purchased in small lots by Tom Christensen of Teller. Small amounts of scheelite were recovered from several gold placer mines.

Mining Operations in 1943

Because of the WPB order closing down all but the smallest gold mines there will be practically no gold placer or lode mining on the Seward Peninsula in 1943. Even before the order was issued, however, most of the miners did not plan to resume operations in 1943. A few intended to continue mining with reduced crews, apparently because their ground is sufficiently rich to be worked profitably in spite of greatly increased mining costs.

It is hoped that cessation of gold mining, combined with the urgent need for other metals, will result in at least a small increase in prospecting and mining for strategic materials. Most placer operators, of course, are not equipped to change over to lode mining, but some of them may find it feasible to mine tungsten from placers. A few miners and prospectors in the vicinity of Nome have already directed their attention to deposits of antimony and tungsten.

Possibilities of Strategic Mineral Production

Among the strategic materials found in significant amounts on the Seward Peninsula are tin, tungsten, antimony and graphite. All of these materials

MINING ON STEWARD PENINSULA

have been mined and shipped at various times, but with the exception of insignificant amounts of tin and tungsten, none are now being produced. Prospecting and development was resumed on a small scale in 1942, however, and it is likely that some antimony will be produced in 1943, as well as larger amounts of tin and tungsten.

During the past season examinations of both lode and placer tin deposits in the York district were made by H. E. Heide of the U.S. Bureau of Mines. As a result of these examinations, operations will probably be resumed in 1943 on several placer tin deposits. Presumably a longer time will be required to start production from the lodes, which are reported to be relatively low-grade.

Listed in the following table are occurrences of placer cassiterite as determined by examination by the Department of Mines of samples of concentrates furnished by Tom Christensen. Additional occurrences are reported in U.S. Geological Survey publications, but available data are far from complete.

<u>Location and description of sample</u>	<u>Relative abundance of cassiterite</u>

Tuttle Cr., Ear Mt. area. Claim #4 below	Common

Intermittent small-scale development was done in 1942 on antimony lodes near Nome; on the Hed and Strand property on Dahl Creek, and on the McDuffee property on Steep Creek. A total of about 6 tons of high-grade stibnite is reported to have been taken out during the development work. Other known antimony prospects in the Cape Nome precinct include the Sliscovitch mine on Manila Creek and an open cut on Grouse Creek, from which a small shipment of stibnite was made in 1941. A number of additional occurrences are listed in "Preliminary Economic Survey of the Seward Peninsula", published in 1940 by the Alaska Planning Council.

Placer scheelite occurs in significant amounts in a number of tributaries of the Snake River, and also in a few tributaries of the Nome River. It has been mined as a byproduct from some of the gold placers, but apparently no attempts have been made to effect maximum possible recovery. Scheelite has also been recovered from dredge concentrates by the U.S. S. R. & M. Co., and during the past season some attention was paid to producing a satisfactory concentrate. On Rock Creek, prospect cuts were bulldozed by the U. S. S. R. & M. Co., in what is apparently a residual scheelite deposit. Samples were taken by H. E. Heide of the U. S. Bureau of Mines.

MINING ON SEWARD PENINSULA DURING 1942

Following is a summary of information concerning mining ground on tributaries of the Snake River, on which placer scheelite has been found. This information was collected by H. E. Heide, from miners in the district and from U.S. Geological Survey publications.

Anvil Creek: upper $\frac{3}{4}$ mi. could possibly be worked. Dredged for width of ~~250~~' water all season.

Snow Gulch: 3000' could possibly be worked. 150' width has been mined. Depth about 6'.

Glacier Creek: 1 mi. dredged 300' wide. Was hydraulicked $\frac{1}{2}$ mi. below dredge. Depth 12'. Water all season.

Monument Creek: Worked by Don Stewart.

Rock Creek: (Sophie Gulch): $1\frac{1}{2}$ mi. long, 200-300' wide, 12' deep; part hydraulicked water all season. Bulldozer cuts made by U. S. S. R. & M. Co.; sampled by H. E. Heide. May work in 1943 if values justify.

Between Rock and Prospect Creeks: 2 gulches, $\frac{1}{2}$ mi. long, 25' wide; generally dry.

Prospect Creek: $\frac{1}{2}$ mi. long, 25' wide, shallow. Possibly water all season.

Sledge Creek: $\frac{1}{2}$ mi. long, 50' wide, shallow. Water all season

Boulder Creek: 4 claims hydraulicked near mouth of Twin Creek. Water all season.

Mountain Creek: trib. of Boulder Cr., may be same as Twin Cr. 3 claims hydraulicked. 100-300' wide; depth 10' in upper part, 25' in lower part. Water all season.

Bangor Creek: dredged $1\frac{1}{2}$ mi. by 200' in 1921. Good pay. Depth 10-18'. Upper creek also mined by Butterfield Co.

Divining Creek: $\frac{3}{4}$ mi. long, 125' wide. Not worked.

Blatchford Creek: $\frac{3}{4}$ mi. long, 50' wide.

Scheelite was also found in a number of samples of placer concentrates, collected by Tom Christensen and examined by the Department of Mines, as shown in the following list.

<u>Location and description of Sample</u>		<u>Relative abundance of scheelite</u>
Buck Cr., Potato Mt. area.	First creek on left limit Buck Cr.	Rare
Camp Cr.,	trib. Lost R., 100' above mouth	Common
Cape Cr.,	Near Tin City. 1400' above mouth	Rare
Cassiterite Cr.	Trib. Lost R. On left limit on cassiterite dike. Also contains small amount of wolframite	Rare
Eldorado Cr.;	Ear Mt. area. Head of creek	Scarce
Vatney Gulch,	trib. upper Eldorado Cr.	Rare
Goodwin Gulch,	near Tin City. Lost hutch of cleaner jig	Scarce
Henry Cr.,	Ear Mt. area	Rare
Kreuger Cr.,	Ear Mt. area	Rare
Monument Cr.,	near Nome. Dredge concentrates	Scarce
Pinguk R.,	west head	Scarce
Rocky Mt. Cr.,	near Nome, close to mouth of creek	Abundant
Quartz Cr.,	Ear Mt. area	Rare
Tuttle Cr.,	Ear Mt. area. Claim #4 below	Scarce
Twin Cr.,	Snake R. area. Left limit bench below forks	Common
York Cr.,	York district	Scarce

Little definite information could be obtained concerning the lode sources of the scheelite. It was reported, however, that lode scheelite has been found, apparently both in quartz veins and in replaced limestone, in the Snake River area, but that no systematic prospecting has been done.

Occurrences of other minerals are mentioned in U.S. Geological Survey publications and are tabulated in "Preliminary Economic Survey of the Seward Peninsula". Worthy of special mention are deposits of graphite at the head of the Grand Central River, from which shipments were made in 1912 and 1916. No record was found in the Nome Assay Office to indicate that they had been examined by the Department of Mines, consequently a preliminary examination at an early date is recommended.

It is evident that the Seward Peninsula is a potential producer of several

strategic minerals. Whether any significant production can be ^{or} affected within the next two years, however, depends not only on the existence of deposits sufficiently high-grade or extensive so that the effort expended in developing and working them will not be disproportionate to their yield, but also on the availability of equipment and men. Placer tin and tungsten could be mined with little delay, since equipment and experienced men are available. Early lode production on any but the smallest scale would be more difficult to effect, because little equipment and few experienced lode miners are available in the region.

Placer tin production could doubtless be increased by increasing the price paid for tin concentrates, or by arbitrarily widening the mining limits of some of the larger deposits and compensating the operators for their losses. Placer scheelite apparently offers the best opportunity of producing tungsten quickly and with equipment already available. During the last war, scheelite was mined from gold placers, but its value was less than that of the gold. At present, when gold is of minor importance, most of the tungsten-bearing placers will lie idle unless special provisions are made. Investigations should be made to determine if any of them contain sufficient scheelite to warrant working.

Examinations of antimony and tungsten lodes should be made to determine if rapid development for at least moderate-scale production is feasible. Small-scale production of antimony is apparently possible under existing conditions.

The Role of the Department of Mines in aiding Strategic Mineral Production.

While in Nome the writer discussed with various people the question of the advisability of reopening the Nome office of the Department of Mines. The consensus was that this would be essential if strategic minerals are to be produced by individuals of limited means, ~~although~~ it alone would not assure their production in substantial quantities. The services of an engineer-assayer are more essential now, however, than when most prospecting was for gold, since few of the prospectors are familiar with strategic minerals or their modes of occurrence. Probably one of

MINING ON SEWARD PENINSULA

his chief functions would be to stimulate the interest of individuals in prospecting and developing strategic mineral deposits. This could be done largely by examining deposits, identifying and assaying minerals, and acting in an advisory capacity.

A second function of an engineer-assayer would be to aid and cooperate with the Bureau of Mines in their work on the Seward Peninsula. This could be done by carrying out surface investigations of strategic mineral deposits, preliminary to detailed examinations by the Bureau of Mines, and by analyzing ore samples taken during the detailed examinations. Mr. E. Heide, in charge of the Bureau of Mines work on the Seward Peninsula in 1942, expressed himself as favoring this cooperation. He mentioned specifically the need for surface examinations of antimony and tungsten deposits preliminary to possible examinations by the Bureau of Mines.

A third function would be to act as deputy agent for the Metals Reserve Company for the purchase of strategic minerals. At present only inconsequential amounts of strategic minerals are available for purchase, but if a program for developing known deposits is carried out, provision should be made for receiving shipments of concentrates and ore.

Inquiries were made as to the availability of facilities for handling, sampling and storing strategic minerals purchased for the Metals Reserve Company. Most of the necessary heavy equipment, such as a crusher and suitable scales, is already in Nome, and according to verbal assurances, will be made available if needed. Mr. A. Polet has promised to procure a suitable structure for the plant, and also lumber for ore storage bins.

Nome Assay Office

A sketch showing the plan of the Nome Assay Office accompanies this report. The building is amply large for any likely uses, but it is poorly insulated and a disproportionate amount of fuel would be needed if it is occupied during cold

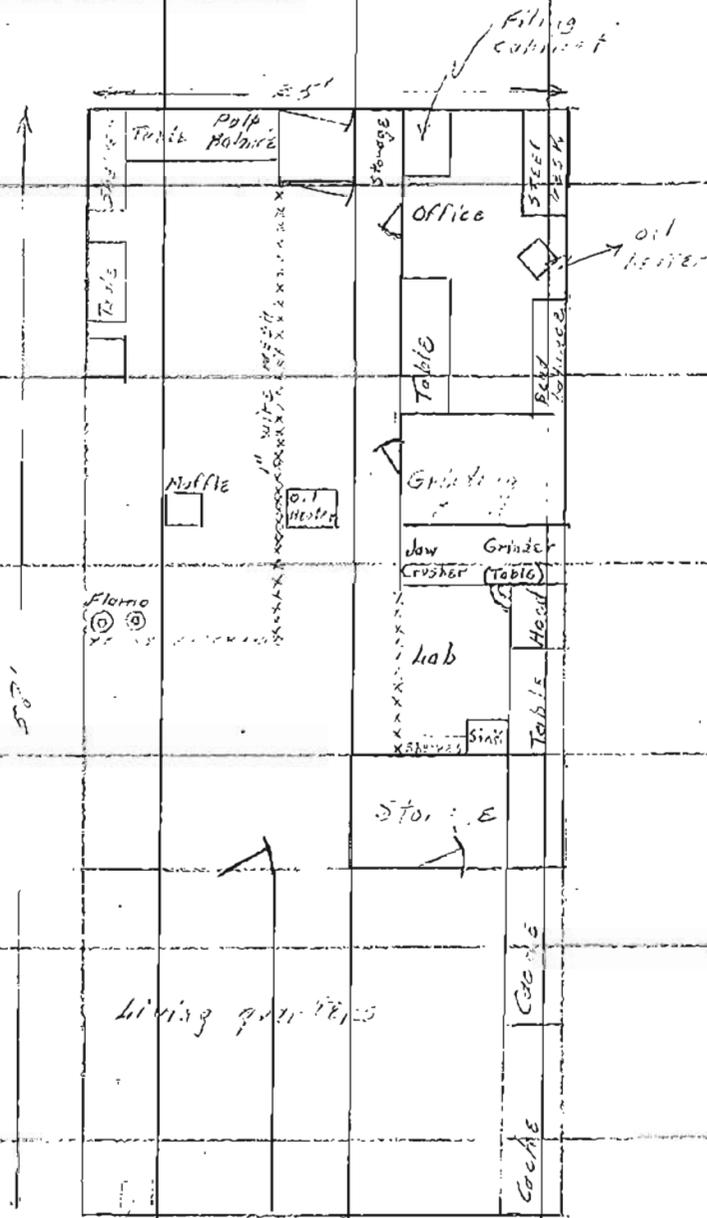

weather. It is not likely, however, that there will be sufficient analytical work during the winter to justify keeping the office open. If it is used only during the warmer part of the year, insulation will probably be unnecessary, especially in view of the present scarcities of material and labor.

A list of the contents of the files of the Nome office appears on pages 10 and 11. An inventory of equipment was also made. It was substantially in agreement with an inventory dated March 20, 1941, which was the latest one found in the files. No books on analytical procedure, or U.S. Geological Survey bulletins were in the office.

If any considerable amount of quantitative analytical work is to be done, the laboratory space should be enlarged to permit the installation of a larger hood as well as more shelf and table space. This could be done by removing a partition between the present laboratory and the storage room. Grinding equipment was in good condition and well arranged. Arrangements are inadequate, however, for drying more than a few samples at a time. A suitable and inexpensive drying rack could be constructed over the oil heater just outside the grinding room, from 1 1/2" pipe and heavy galvanized wire netting.

Supplies and equipment on hand are inadequate for analytical work. Appended is a list, prepared by Eskil Anderson and A. E. Glover, of material needed for quantitative analysis of ores of antimony, tin and tungsten. Many of the items may be difficult to purchase at present through usual channels, but in some cases, second hand equipment may be obtainable. For example, at the University of Alaska are several surplus chemical balances; one of these would be suitable for use at Nome. Considerable assay equipment is said to be stored at an old tin mine on the Lost River, but nothing specific could be learned of its condition or of what it consists.

MINING ON SEWARD PENNINSULA

Mining Short Course

Inquiries were made in Nome concerning the desirability of a mining short course in the spring of 1943, to be given by a representative of the Department of Mines, under the jurisdiction of the University of Alaska Extension Service. Considerable interest in such a course was expressed by many of the soldiers stationed near Nome, but it would be difficult to estimate how many would be interested to the extent of actually attending classes. Mr. A. Polet of Nome believed that attendance might reach 500. His estimate is probably somewhat high; a more likely one may be 50-100. Some of the army officers are willing to cooperate because they feel that the course would improve the morale of the men. If a large number of men attend, the cooperation of the Army and of the citizens of Nome will be required in order to make sufficient facilities available.

H. G. Wilcox, Dean of the School of Mines at the University of Alaska, has been informed of the situation in Nome, and has expressed his desire to offer a short course if the services of an instructor can be secured. It is suggested, therefore, that Eskil Anderson of the Department of Mines be authorized to act as instructor for a period of a month to six weeks, beginning in early March. His presence in Nome at that time would also permit him to prepare laboratory and field equipment for the next field season, and to become acquainted with the people and conditions of the Seward Peninsula.

Acknowledgments

Information used here was furnished by many individuals; among them Mr. Hartford of the U. S. S. R. & M. Co. and Mr. Polet were especially helpful. The cooperation of H. E. Heide and Tor Christensen of the U.S. Bureau of Mines is also gratefully acknowledged.
