Survey of the sand-and-gravel potential of
Mental Health Grant Lands in Alaska

by

Richard D. Reger
Division of Geological and Geophysical Surveys

Introduction

On August 19, 1987, the Division of Geological and Geophysical Surveys (DGGs) was asked by the Division of Land and Water Management (DLWM) to initiate a mineral-resource assessment of Mental Health Grant Lands (1.0 million acres given to the State of Alaska by the federal government for the purpose of supporting mental health programs) as well as about 5.3 million acres of additional state lands (termed Legislatively Designated Pool Lands). Then in an October 6 DLWM memorandum, the area of pool lands to be evaluated was increased to about 8.3 million acres. The proposed DGGs mineral-resource evaluation includes an assessment of sand-and-gravel resources.

An initial set of 86 topographic maps (1:63,360 scale) showing boundaries of 3212 parcels and identifying DLWM parcel numbers for 1.0 million acres of Mental Health Grant Lands was received in Fairbanks about September 15 and the aggregate-resource evaluation began immediately. DLWM initially requested that DGGs provide the monetary value of aggregate resources in the 3212 parcels shown on the maps. However, a survey of available data demonstrated that insufficient information exists for aggregate volume and quality to obtain monetary results. Therefore, it was agreed that the relative worth of sand-and-gravel deposits could be based on aggregate potential rather than monetary worth. The purpose of this report is to summarize the results of the DGGs evaluation of the sand-and-gravel potential for the 1.0 million acres of Mental Health Grant Lands contained in the 3212 parcels identified in the initial set of DLWM maps.

Rationale and Methodology

This survey is based on landforms. Field and laboratory studies of Alaskan landforms and their materials demonstrate that each landform has a definite composition or range of composition wherever that feature occurs (Kreig and Reger, 1976, 1982). By identifying the landforms in each parcel, a reliable estimation can be made of the chances of locating high-quality sand-and-gravel deposits in the parcel.

For this study, five classes of aggregate lands are identified; they range from lands with very high potential for sand and gravel (high-quality deposits are known or almost certain) to lands with very low potential (high-quality deposits are known to be absent or very unlikely)(table 1). For each class, an estimate is made of the rater's confidence that high-quality sand and gravel will be found in the parcel (based on the type of landforms present and the percentage of the parcel they occupy), criteria are established for each aggregate-land class, and dominant landforms that

typify that aggregate-land class are identified.

For each parcel, the rater first identified dominant landforms, assigned a value for aggregate potential (on a scale of 1 through 5), and then subjectively assigned a value for the quality of the data upon which the aggregate potential is based. Five data-quality classes (ranging from very good to very poor) were developed for this study based on the reliability of available geologic information (table 2). Obviously, estimates of aggregate potential based on high-quality information are much more reliable than estimates based on low-quality information.

In actual practice, because of the large number of parcels involved in this evaluation, a four-stage screening process was initiated. The initial step involved screening available 1:63,360-scale geologic maps; data on these maps are judged to be of good to very good quality and class I through V aggregate lands can readily be identified on them. The second stage involved screening 1:125,000- and 1:250,000-scale geologic maps, which provide fair to poor data because surficial-geologic units are typically composed of more than one landform; only obvious class I through V aggregate lands could be reliably identified on these maps. The third stage included interpretation of 1:65,000- or larger scale aerial photographs where photo coverage is available; the results of this method are judged to be good to excellent but the technique is very time consuming. Only 7.0 percent of the parcels were evaluated using aerial photographs. The final stage involved rapid screening of 1:63,360-scale topographic maps in areas where geologic data or aerial photographs are lacking. Only obvious landforms, such as glacier-scoured bedrock, braided floodplains and large alluvial fans, could be reliably identified by this method; data quality is judged to be very poor compared to areas where field work and photointerpretation verify a wide variety of landforms. Less than 0.3 percent of the parcels were evaluated in this manner.

Data Presentation

Appendix A is intended for use with the topographic maps showing parcel locations and DLWM identifier numbers. It lists by quadrangle and a modified DLWM parcel number the aggregate-land potentials and data-quality values for all 3212 parcels identified as Mental Health Grant Lands in the initial set of 1:63,360-scale topographic maps. DLWM identifier numbers were modified by inserting one or more zeroes between the regional code letter (C, F, S) and the first non-zero number to facilitate computerized sorting so that parcels could be readily located in Appendix B.

Appendix B is intended for use without the topographic maps. It lists by modified DLWM parcel number and quadrangle the aggregate-potential and data-quality values for all 3212 parcels.

In both appendices, numerous parcels occur in more than one quadrangle (some in as many as four quadrangles). Occurrences in other quadrangles are listed in the right column in both appendices. A total of 48 numbers (C1061 through C1070 and C1144 through C1181) are duplicated in the Petersburg C-3 and Skagway B-3 Quadrangles (which are not adjacent). These parcels are not cited in the right columns of Appendix A or B because different parcels are actually involved. Aggregate ratings frequently

change in a given parcel across quadrangle boundaries because percentages of areas occupied by dominant landforms differ in different quadrangles. Similarly, data-quality values frequently change in a given parcel across quadrangle boundaries because different sources of information are available. A total of 46 published technical reports were consulted during this study (Appendix C). Numerous unpublished sources of information are not cited.

Work sheets were completed for each quadrangle but are not included in this summary. They list unmodified DLWM parcel number, screening stage, dominant landforms, aggregate-land class, data-quality class, technical references used, and other quadrangles in which each parcel occurs.

Discussion

The number of parcels of Mental Health Grant Lands is about equal in the south-central region (1356 parcels or 42.2 percent) and in the southeastern region (1386 parcels or 43.2 percent). The northern region includes 470 parcels or 14.6 percent of the total. Acreages contained in various classes of aggregate potential and data quality could not be analyzed because no data on the size of each parcel were provided.

Table 3 summarizes the regional distribution of aggregate-potential values and data-quality values for the 3212 parcels of Mental Health Grant Lands. Values for aggregate potential and data quality for parcels split among two to four adjoining quadrangles are combined in Table 3 to reflect the most representative situation based on which landforms occupy most of the combined parcel.

In the northern region, 61.0 percent of the parcels have low to very low potential for high-quality sand and gravel and only 23.4 percent have very high potential. This region has the highest percentage (83.2) of the most reliable geologic information of all three regions.

In the south-central region, aggregate-land potential is fairly uniformly distributed among all five classes, with a low peak (45.5 percent) in the moderate-potential class. In general, data quality is only slightly better for classes of moderate to very high potential in this region than in the northern region.

Close to 80 percent of the parcels in the southeastern region have low to very low potential for high-quality sand-and-gravel deposits because they include extensive areas of glacier-scoured bedrock and thin glacial deposits (primarily till). Only 12.2 percent (169) of the parcels (primarily in the Skagway Quadrangle) were assigned a very high potential for high-quality aggregate. In general, there is much less reliable geologic information available for the southeastern region compared to the rest of Alaska.
