Background

The Alaska DGGS has leveraged contractors in our geologic map/data conversion to GeMS projects for over 3 years

STATEMAP FY21: 8 Maps

STATEMAP FY22: 11 Maps

STATEMAP FY23: 14 Maps

DMT Talk on the subject in 2022,
<https://doi.org/10.14509/30890>

This talk will discuss the efficiencies we have introduced, particularly focusing on the use of feature templates into our workflow.

Changing views on the process

Original Ideas:

- Firm Fixed Contract. New contract ~ annually
- Extensive Contractor training required with GeMS and AK GeMS
- Emphasis on Geologic experience versus Geospatial
- In House Gems Savy Geologist fixes all issues after contractor work

Newer Ideas:

- Set up Master Agreement with Contractor – Kinney Engineering
- Contractor only requires general GeMS knowledge
- Emphasis on Geospatial versus Geologic
- In House Gems Savy Geologist prepares extensive templates and packages prior to contractor work
- Limited effort required after contractor

Every Map gets a Contractor Package

- Conversion Notes
- ArcPro Project File & AK GeMS DB
 - Feature Templates
 - Representative objects digitized from Legend
- Original georeferenced map image and Report
- Style File
- Toolbox
 - Planarize contacts and faults
 - Create Map Unit Polygons from Contacts and Faults with Map Unit Points

Conversion Notes

Digitizing notes: russian_mission_c1_quads_geo

Map publication: <https://dggs.alaska.gov/pubs/id/2290>

Coordinate system of geologic map feature dataset: NAD 1927 UTM Zone 4N

The map border has been digitized in the feature classes product_info (symbol = ak.101.02) and contacts_and_faults (symbol = 31.08). Snap new contacts and faults to the contacts_and_faults map border.

The feature template examples for this map are drawn adjacent to the legend on the georeferenced map sheet.

Layer details and style file symbol codes:

pr109_sh001_r1.tif

Georeferenced .tif raster image of original map, including map collar with legend. Coordinate system is UTM NAD27 Zone 4.

map_unit_points

1. "Synthetic" map_unit_points features corresponding to each map unit in the description_of_map_units table, with feature template examples digitized; used to identify map_unit_polys polygons to be generated automatically from digitized contacts_and_faults line features.
2. Create one synthetic map_unit_points feature within each polygon defined by contacts_and_faults features.
3. Digitize the Kuskokwim River as unit "Water", but small lakes can be included with surrounding map units.

contacts_and_faults

1. The original map used a solid line symbol for "approximately" located contacts and faults; the GeMS digital version will use a dashed line
 - a. Identity and existence certain, location approximate – (01.01.03)
2. Boundaries
 - a. Outer edge of map – (31.08)
 - b. Map border had been digitized in contacts_and_faults; snap new contacts_and_faults to this feature.
3. There are a few dashed contacts on the original map that are not in the legend; digitize these as "approximate" as with most of the other contacts.

cartographic_points

1. There are four versions of the "Fault, apparent offset" symbol; choose the one that works best for each location and rotate the symbol as needed – (02.11.ak.02, 03, 04, 05)
2. Bearing of paleocurrent: two symbols in Kus at the Kuskokwim river near the eastern edge of the map; there may be more – (09.001)
3. Cross section endpoints – these have been digitized with label only, no symbol; default point symbol edited to no outline color and no fill color, to be invisible. Completed/drawn for this map, as an example.

orientation_points

1. Inclined features:
 - a. Locate and digitize features, and rotate as needed; the "azimuth" field will populate automatically.
 - b. Manually populate the "inclination" field with the dip value on the map; DGGS will copy the inclination value to the "label" field.
2. Horizontal features:
 - a. Azimuth = 0
 - b. Inclination = 0 (label will be <Null>)
3. Vertical features:
 - a. Azimuth = (derived from symbol rotation)
 - b. Inclination = 90 (label will be <Null>)

geochron_points

1. K-Ar age-date locality
 - a. Locate and digitize features, and add 'label' to feature class table.
 - b. Age data will be added to feature class table by DGGS.

geologic_points

1. Glacial erratic locality - (30.03.16)
2. Major oxide sample locality – (31.21)
3. Geochemical sample locality at prospect or site of mineral occurrence – (19.03.ak.01)

review_item_point

Web feature service layer, edited by DGGS and contractor, to identify features/areas requiring revision.

https://services1.arcgis.com/7HDIw78fUIM2BWn/arcgis/rest/services/review_item_point/FeatureServer

cartographic_lines

1. Cross section lines – (31.10)
2. Completed/drawn for this map, as an example.

geologic_lines

1. Bedding trends in map unit Kus – (01.02.03)
2. These are mapped in the northeast corner of the map, and possibly elsewhere.
3. Example polygon is drawn adjacent to Kus in raster Description of Map Units.

structure_lines

1. Syncline: accurately located (05.05.01) and concealed (05.05.07)

overlay_polys

1. Ankerite and sericite alteration in map unit TKsy; example polygon is drawn adjacent to TKsy in raster Description of Map Units.

[illegible]

MAP SYMBOLS

Contact—Approximately located

High-angle fault—Approximately located; dotted where concealed.
U, upthrown side; D, downthrown side. Arrows show direction of relative movement

Syncline, showing trace of axial plane. Dotted where concealed

Conclusion

- The Master Agreement has and will save us time
- The investment in time to prepare contractor packages that include rich attributed feature templates save time and money in the end.
- Having an expert Digitize the map's legend decreases confusion for the contractor and as a result saves money.
