This publication released by the Division of Geological & Geophysical Surveys was produced and printed in Fairbanks, Alaska at a cost of \$13 per copy. Publication is required by Alaska Statute 41, "to determine the potential of Alaskan land for production of metals, minerals, fuels, and geothermal resources; the location and supplies of groundwater and construction materials; the potential geologic hazards to buildings, roads, bridges, and other installations and structures; and shall conduct such other surveys and investigations as will advance knowledge of the geology of Alaska."

Reconnaissance engineering-geologic map of the Sagavanirktok B-1 Quadrangle, eastern North Slope Alaska

Research supported by the U.S. Geological Survey, National Cooperative Geologic Mapping Program, under USGS award #99HQAG0121. The views and conclusions contained in this document are those of the authors and should not be interpreted as necessarily representing the official policies, either expressed or implied, of the U.S. Government.

# RECONNAISSANCE ENGINEERING-GEOLOGIC MAP OF THE SAGAVANIRKTOK B-1 QUADRANGLE, EASTERN NORTH SLOPE ALASKA

by  
DeAnne S. Pinney<sup>1</sup>

## DISCUSSION

This map illustrates potential near-surface sources of various geologic materials that may be useful for construction. Field observations indicate that each geologic unit (for example, stream alluvium) has a definite composition or range of composition. Therefore, the probable presence of materials is interpreted from the distribution of geologic units on the geologic map of these quadrangles. This map is generalized and is not intended to show exact locations of specific materials. The purpose is to indicate general areas that deserve consideration for certain materials and to eliminate other general areas from consideration for these materials. Local variations are common, especially near unit boundaries.

Potential uses of map units are qualitatively summarized in tables 1 and 2, which show potential availability of various construction materials in each engineering-geologic unit. Precise economic evaluations of specific deposits as sources of construction materials will require detailed examination of each deposit, including areal extent, volume, grain-size variation, thickness of overburden, thermal state of the ground (ground temperature), and depth to water table as well as logistical factors, demand, and land ownership.

This map also addresses some of the principal hazards and engineering considerations that may be associated with mapped geologic units based on their general physical properties, conditions that are characteristic of their depositional environment, and topography. Potential geologic hazards directly relate to surficial-geologic units because (1) the processes that formed the deposits may be hazardous where still active, (2) postdepositional conditions (like ground ice) may present additional hazards, and (3) materials characteristically present in the deposits are known to be susceptible to certain hazards (like liquefaction). In general, natural hazards in lowlands are related to a lack of bearing strength (such as saturated, organic-rich swamp deposits and thawing of ice-rich permafrost) and to seasonal flooding. In highlands, mass movements may be a serious local concern. Local, unevaluated factors affecting mass movement (rock avalanches, landslides, and debris flows) include sediment textures, bedrock structures, and water content. This map is intended only as a general guide to some common hazards that may be present, depending on other factors like topography and water content, and does not preclude the presence of other unevaluated or site-specific hazards.

This map was derived electronically from the geologic map of the area (Reifensuhl and others, 2000) using Geographic Information System (GIS) software. It is only locally verified by ground observations during brief field visits. The results should be considered reconnaissance in nature.

## DESCRIPTION OF MATERIALS UNITS

### UNCONSOLIDATED MATERIALS

- GS Fluvial and glaciofluvial gravel, sand, and silt. Chiefly (estimated >80 percent) clean sand and gravel. Grain size, sorting and degree of stratification are variable. Permafrost may be present, especially in older deposits. Older deposits may contain highly weathered clasts and thus may not be suitable as construction materials. Rare oversized materials may include boulders. Includes primarily GP and GW of the Unified Soil Classification (Wagner, 1957).
- GM Poorly- to moderately well-sorted clay, silt, sand, gravel, and diamicton of colluvial, fluvial and glacial origins. Includes angular, unsorted talus debris and chaotically deformed colluvium derived from landslides. Engineering applications vary widely due to large range of grain size and sorting properties. Commonly frozen. Estimated 20-80 percent coarse, granular deposits with considerable oversized material. Includes primarily GC and GM of the Unified Soil Classification (Wagner, 1957).

Table 1. Generalized engineering properties of unconsolidated units

Map unit	Drainage	Permafrost (observable based on soil pits and natural exposures)	Frost susceptibility	Slope stability	Bearing strength	Potential primary production	Parent engineering considerations	Component geological units
GS	Good in recent level, where permafrost has developed and where covered by silt colluvium and peat. Silt colluvium and peat interfused into gravelly matrix in older alluvium deposits, locally present in older alluvium deposits mantled by silt and peat. May be present discontinuously in older terrace deposits; may be ice T race gravelly generally faces, where sudden, rapid collapse may occur due to stream erosion or surface loading. Fill terraces may be subject to slumping and rapid erosion	Minimal to well-drained modern alluvium, may be moderate to intense in active layer silt and peat subject to thaw instability and erosion	Generally stable, except for ice-rich permafrost-bearing deposits adjacent to thaw instability and erosion	Variable, but generally fair to poor	Unclassified fill, although some to snow avalanches, debris flows, subsidence, and local flows, subsidence may be a function. Therefore, tension may be a source of small cavities should be excavated during excavation and construction activities. Saturated or over-saturated deposits may be subject to local slope failure, and local subsidence may occur in areas of permafrost.	Variable but generally fair to poor	Unclassified fill, although some to snow avalanches, debris flows, subsidence, and local flows, subsidence may be a function. Therefore, tension may be a source of small cavities should be excavated during excavation and construction activities. Saturated or over-saturated deposits may be subject to local slope failure, and local subsidence may occur in areas of permafrost. SM	Highly variable depending on stage of permafrost development. Very poor in frozen deposits	High in deposits with high proportion of silt or where permafrost is, especially ice-rich, and massive ground ice may be present, especially in deposits with organic silt and areas of poor drainage. Thaw shrinkage and earthflows containing excess ice, subject to unstable following surface disturbance where deposits contains ice-rich permafrost.	Silt deposits are thaw unstable where permafrost is, especially in areas of poor drainage. Thaw shrinkage and earthflows containing excess ice, subject to unstable following surface disturbance where deposits contains ice-rich permafrost.	Silt deposits are generally poor to slumping, slough, Qis, Qsc, Qsu, Qst, Qsv, Qsw, Qsx, Qsy, Qsz, Qta, Qtb, Qtc, Qtd, Qte, Qtf, Qtg, Qth, Qti, Qtj, Qtk, Qtl, Qtm, Qtn, Qto, Qtp, Qtq, Qtr, Qts, Qtt, Qtu, Qtv, Qtw, Qtx, Qty, Qtz, Qua, Qub, Quc, Qud, Que, Quf, Qug, Quh, Qui, Quj, Quk, Qul, Qum, Qun, Quo, Qup, Quq, Qur, Qus, Qut, Quu, Quv, Quw, Qux, Quy, Quz, Qva, Qvb, Qvc, Qvd, Qve, Qvf, Qvg, Qvh, Qvi, Qvj, Qvk, Qvl, Qvm, Qvn, Qvo, Qvp, Qvq, Qvr, Qvs, Qvt, Qvu, Qvv, Qvw, Qvx, Qvy, Qvz, Qwa, Qwb, Qwc, Qwd, Qwe, Qwf, Qwg, Qwh, Qwi, Qwj, Qwk, Qwl, Qwm, Qwn, Qwo, Qwp, Qwq, Qwr, Qws, Qwt, Qwu, Qwv, Qww, Qwx, Qwy, Qwz, Qxa, Qxb, Qxc, Qxd, Qxe, Qxf, Qxg, Qxh, Qxi, Qxj, Qxk, Qxl, Qxm, Qxn, Qxo, Qxp, Qxq, Qxr, Qxs, Qxt, Qxu, Qxv, Qxw, Qxx, Qxy, Qxz, Qya, Qyb, Qyc, Qyd, Qye, Qyf, Qyg, Qyh, Qyi, Qyj, Qyk, Qyl, Qym, Qyn, Qyo, Qyp, Qyq, Qyr, Qys, Qyt, Qyu, Qyv, Qyw, Qyx, Qyy, Qyz, Qza, Qzb, Qzc, Qzd, Qze, Qzf, Qzg, Qzh, Qzi, Qzj, Qzk, Qzl, Qzm, Qzn, Qzo, Qzp, Qzq, Qzr, Qzs, Qzt, Qzu, Qzv, Qzw, Qzx, Qzy, Qzz	High in deposits with high proportion of silt or where permafrost is, especially in areas of poor drainage. Thaw shrinkage and earthflows containing excess ice, subject to unstable following surface disturbance where deposits contains ice-rich permafrost.	High in deposits with high proportion of silt or where permafrost is, especially in areas of poor drainage. Thaw shrinkage and earthflows containing excess ice, subject to unstable following surface disturbance where deposits contains ice-rich permafrost.	High in deposits with high proportion of silt or where permafrost is, especially in areas of poor drainage. Thaw shrinkage and earthflows containing excess ice, subject to unstable following surface disturbance where deposits contains ice-rich permafrost.	High in deposits with high proportion of silt or where permafrost is, especially in areas of poor drainage. Thaw shrinkage and earthflows containing excess ice, subject to unstable following surface disturbance where deposits contains ice-rich permafrost.
OR	Very poor, often with standing water.	Generally frozen except near stream cuts	Very high. Thaw unstable following surface disturbance	Generally poor, especially where thawed permafrost is abundant, extreme frost	May be suitable for horticultural production, extreme frost	Generally poor, especially where thawed permafrost is abundant, extreme frost	Generally poor, especially where thawed permafrost is abundant, extreme frost	Generally poor, especially where thawed permafrost is abundant, extreme frost

<sup>a</sup>Source of geologic units: Reifentuhl, R.R., Pinney, D.S., Mull, C.G., Harris, E.E., LePain, D.L., Pinney, D.S., and Wallace, W.K., 2000, Geologic map of the Sagavanirktok B-1 Quadrangle, eastern North Slope, Alaska: Alaska Division of Geological & Geophysical Surveys Report of Investigations 2000-1a.

SM Silt deposited primarily by wind and reworked by fluvial and colluvial processes. May be organic rich. Commonly frozen and ice-rich, especially on north-facing slopes. Chiefly fine materials. Estimated >80 percent silt, sand, and clay. Includes primarily ML, MH, and SM of the Unified Soil Classification (Wagner, 1957).

OR Organic-rich silt and peat in bogs and thaw lake basins. Commonly frozen and ice-rich due to the excellent insulating properties of peat. Generally water-saturated. Chiefly organic materials. Estimated >50 percent peat, organic sand, or organic silt. Includes Pt of the Unified Soil Classification (Wagner, 1957).

### BEDROCK MATERIALS

- BC Medium-jointed, fine- to coarse-grained sedimentary carbonate rocks. Includes limestone, and dolostone.
- BM Medium-jointed, fine- to medium-grained quartzose sedimentary rocks. Includes quartzose sandstone and conglomerate, quartzite, and chert.
- BO Rocks of mixed lithology and very fine-grained sedimentary lithologies that are generally poorly suited for use as construction materials. Includes shale, siltstone, graywacke and argillite.
