GOLD ANOMALIES AND MAGNETOMETER PROFILE DATA
ESTER DOME AREA, FAIRBANKS DISTRICT,
ALASKA

By
D. L. Stevens, R. B. Forbes and D. B. Hawkins^{1/}

Abstract

Gold analysis of grab and auger samples of bedrock taken along the new Ester Dome Road reveals that this road cuts several mineralized zones characterized by anomalous concentrations of gold. The results of a magnetometer traverse along this road indicate that the negative magnetic anomalies along the traverse may be correlative with the gold anomalies. The presence of previously unreported gold anomalies indicates that additional prospecting may be warranted.

EXPLANATION

The purpose of this brief report is to present previously unpublished data on the gold mineralization in the Ester Dome Area, Fairbanks District, Alaska. These data were obtained by the University of Alaska as part of the U. S. Geological Survey's Heavy Metals Program (Contract No. 14-08-0001-10919).

PREVIOUS WORK

The more productive gold-bearing quartz veins in the district lie in a belt that extends from the Fairbanks Creek area southwest to Pedro Dome and extends for about 10 miles farther southwest from Pedro Dome. The Ester Dome gold-bearing lodes about 20 miles southwest of Pedro Dome define the southwest terminus of the mineralized belt. The intervening area appears to be barren of mineralization. Hill (1933, p. 44-45) suggested that the northeastern part of the mineralized belt was coincident with an anticline. Later work by Forbes and Brown (1961), and Brown (1962) reinforced this theory and showed that the Ester Dome lodes appear to be localized on the southeast flank of a structural dome, which suggests that metalliferous veins are related to late arching and accompanying fracture and shear.

Intensive prospecting in the early 1900's followed by recurrent mining and development activity up to the present has delineated the more obvious Ester Dome lodes and/or vein systems. Chapman and Foster (1967) have compiled and summarized published and unpublished data on the Ester Dome lodes, including the locations of various claims, prospects and mines with recorded production.

THIS STUDY

Outcrops are scarce on the higher elevations of Ester Dome; consequently, bedrock data for this area are limited. Prior to the present study, bedrock data from lower elevations were gained from prospect pits, trenches and mine workings.

In 1966, a new road was constructed which traversed the east flank of Ester Dome. This construction produced many road cuts and rubble crops which were not available to earlier workers. These exposures permitted the sampling of extensions of possible lodes and/or mineralized zones which had been detected by previous work.

During the summer of 1968, both outcrop (grab) and auger samples were taken along this road. Samples of bedrock were obtained from auger holes drilled at 100 ft. intervals and from grab samples taken where road cuts and rubble crops were available.

Analytical Methods

Gold Assay

The gold assay values reported here were determined by atomic absorption spectrometry at the University of Alaska using an aqua-regia digestion procedure. The routine detection limit for gold by this method is 0.02 ppm (parts per million). A value of 0.10 ppm or more gold probably represents an anomalous concentration of gold in the rocks of this district.

Spectrographic Analysis

With the exception of gold, the concentration of various trace elements was determined spectrographically at the University of Alaska using a modification of the method utilized by the U. S. Geological Survey.

The method employed at the University of Alaska differs from that of the U. S. Geological Survey in that the spectrographic plates were read by means of a densitometer and the 6-step method of reporting the analytical results was not utilized.

Magnetometer Traverse

Geomagnetic data were taken with a Sharpe fluxgate (vertical) magnetometer

at each of the auger stations. Corrections were applied to the magnetometer readings, based on diurnal magnetograms recorded at the College observatory.

RESULTS

The results of the gold analyses and the magnetometer traverse are plotted on Plate I. For those samples not part of the Ester Dome Road traverse, only those containing anomalous quantities of gold are shown plotted in Plate I. The gold assay values and trace element data of all samples are given in Table 1. Blank spaces in the columns of Table 1 for the various trace elements indicate that these elements were sought but not detected in the spectrographic analysis.

CONCLUSIONS

The gold values plotted on Plate I show that the new Ester Dome Road cuts several mineralized zones characterized by anomalous concentrations of gold and that such anomalies may be correlative with negative magnetic anomalies. In some areas, previously unreported anomalies have been detected and additional prospecting may be warranted.

ESTER DOME TRACE ELEMENT DATA

SAMPLE NO.	MATERIAL	LOCATION	As	Au*	Fe%	Mg%	Ca%	Tl	Mn	Ag
ED-9-1-20	Vein quartz	<u>Anna May Property</u> <u>Between Sheep and Happy Cr.</u>		<.02	.57	.08	<.13	595	<114	
-9-1-21	Vuggy Qtz with clays	Eastern end, upper trench								
-9-1-22	Vein Qtz with Mn-Fe stains and scorodite	Upper stripped area	2620	1.46	1.43	.08	<.13	300	132	
-9-1-23	Gouge	" " "	2560	162.0	2.94	.09	<.13	510	114	7.50
-9-1-24	Altered Qtz mica schists	" " "		.20	3.36	.51	<.13	9440	<114	
-10-1-1	Blue gray Qtz	4000' SE of Summit		<.02						
-10-2-1	Vein Qtz	" " "		<.02						
-10-1-2	" "	" " "		<.02						
-11-1-1	" "	Ridge between Eyes & Bullion Creeks		<.02						
-11-1-2	Altered Qtz-Mica Schist	" " " "		<.02						

Emission Spectrograph Analyses in ppm unless otherwise indicated *Au determined by Atomic Absorption

ESTER DOME TRACE ELEMENT DATA

SAMPLE NO.	MATERIAL	LOCATION	As	Au*	Fe%	Mg%	Ca%	Tl	Mn	Ag
ED-11-2-1	Vein Qtz	Ridge between Eva & Bullion Creeks		1.06						
-11-2-2	Qtz mica schist with Qtz boudins	" " " "		<.02						
-12-1-1	Vein Qtz	Ridge between St. Patrick & Happy Creeks		.11						
-12-1-2	" "	" " " "		<.02						
-12-2-1	Altered Qtz mica schists	" " " "		.17
